PT New interleukin-18 binding protein - useful for treating human
PT diseases, including autoimmune disease and inflammation
PS Disclosure: Page 60-63: 100pp; English.
CC The present sequence comprises human interleukin-18 binding protein
CC (IL-18BP) genomic DNA. It was produced from 5 genomic clones
CC isolated from a human genomic library by screening with full-length
CC human IL-18BP cDNA. No exon coding for a transmembrane receptor
CC was identified within the 7.8 kb sequence. 4 Splice variant clones
CC (see X24749-52) were identified that code for putative soluble
CC secreted proteins, designated IL-18BP-a-d (see W8004-007). The
CC IL-18BP locus contains an additional gene, coding for the nuclear
CC mitotic apparatus protein 1 (NMN1), positioned on the minus strand.
CC This localised the IL-18BP gene to human chromosome 11q13(36).
CC IL-18BP polypeptides capable of binding IL-18 and/or modulating
CC and/or blocking IL-18 activity are provided by the invention.
CC Methods for their isolation and recombinant production, DNA vectors
CC expressing them, vectors useful for their expression in humans and
CC other mammals, and antibodies against them are also provided.
CC IL-18BP polypeptides, and DNA encoding them, can be used to treat
CC conditions requiring the protein (claimed). Such conditions
CC include autoimmune diseases, type I diabetes, rheumatoid arthritis,
CC graft rejections, inflammatory bowel disease, sepsis, multiple
CC sclerosis, ischemic heart diseases, ischemic brain injury, chronic
CC hepatitis, psoriasis, and chronic/acute pancreatitis. IL-18BP is
CC also useful for purifying IL-18 (claimed).

PT Vaccine against liver fluke infection in ruminants. esp. sheep -
PT comprises glutathione-S-transferase extracted from adult fasciola
PT hepatica worms.
PS Claim 9; Fig 15; 44pp; English.
CC A cDNA library was constructed from total RNA of adult worms of the
CC Compton strain of Fasciola hepatica in either lambda g11 or lambda
CC ZAP phage vectors. The library was screened with rabbit antiserum
CC raised to purified GSTs of F. hepatica. Clone GST-7 was isolated from
CC a lambda ZAP library and was used to isolate other homologous
CC sequences. It contains a poly(A) tail indicating the 3'
CC end of mRNA has been cloned. The protein derived from this sequence
CC begins 7 amino acids from the N-terminus of GST(FH26a) and is homo-
CC logous to it.
CC This sequence can be used in a vaccine for preventative treatment
CC of liver fluke in ruminants.
CC See also 005732, 005734-005736 and R06503-R06506.

PT Kidney injury associated molecule, KIM, polypeptides - upregulated  
PT in injured or regenerating tissues, useful to promote tissue growth  
PT and regeneration, especially to treat renal conditions

PS Claim 9; Page 70-71; 213pp; English.

CC The present sequence represents a kidney injury associated molecule  
CC (KIM) cDNA clone. KIM proteins can be administered therapeutically  
CC by expressing KIM encoding polynucleotides, to promote growth and/or  
CC survival of damaged tissue (e.g. renal tissue), since the KIM proteins  
CC are upregulated in injured or regenerating (especially renal) tissues.

CC KIM fusion proteins, conjugates, antibodies and vectors can also be used  
CC therapeutically, e.g. these or the KIM proteins may be included with an  
CC acceptable carrier in pharmaceutical compositions, useful for therapy/  
CC prophylaxis of conditions associated with dysfunction/dysregulation of  
CC KIM genes or proteins, especially renal diseases or impairments of renal  
CC function in humans (e.g. acute renal failure, acute nephritis). The  
CC polynucleotides can be used to produce antisense sequences which, when  
CC internalised into cells, can disrupt expression of a cellular KIM gene,  
CC also useful in therapy (e.g. to block the growth of tumours dependent on  
CC KIM for growth) or compositions. The proteins and polynucleotides are  
CC useful diagnostically e.g. to detect and quantify renal injury/disease  
CC (indicative of increased risk, or presence of, renal injury or impaired  
CC function), or abnormal responses to tissue injury (indicative of  
CC increased risk, or presence of, an autoimmune response or abnormal  
CC tissue growth arising from/affecting renal tissue). The proteins can  
CC also be used to locate KIM-producing cells (especially specific loci,  
CC e.g. tissue masses abnormally producing/expressing KIM such as tumours  
CC arising from/affecting renal tissue), by contacting cells with an

CC imageable KIM-binding reagent and imaging reagent accumulation.

PT Enriched oligonucleotides and corresp. sequences - used as  
PT markers for human genes transcribed in-vivo, facilitate tagging  
PT of most human genes

PS Example 4; Page 262; 500pp; English.

CC The Expressed Sequence Tag was isolated from a human brain cDNA  
CC library as part of a large set of ESTs which can be used as markers  
CC for human genes transcribed in vivo. They can be used to facilitate  
CC tagging of most human genes, for mapping locations of expressed genes  
CC on chromosomes, for individual or forensic identification, for mapping  
CC locations of disease-associated genes, for identification of tissue  
CC type, and for prep. of antisense sequences, probes and constructs.

CC EST01961 has been putatively identified as encoding a Notch/Xotch  
CC protein. See also 059041-061440.

COMMENT E. coli transposon insertion: The present data does not contain E.  
coli transposon sequences which integrated in the  
original/previous sequences. We determined the boundary between  
the insertion and genomic sequences experimentally, removed the  
insertion sequences, reconstituted the present data. The sequencing  
project is supported by Japan Science Technology Corporation (JST)  
and the Institute of Physical and Chemical Research (RIKEN).

COMMENT      On Jun 2, 1999 this sequence version replaced gi:4760255.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continue. The sequence may be
contaminated with foreign sequence from E.coli, yeast, vector,
phage, etc.
* NOTE: This is a 'working draft' sequence.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.

## Notes:

The Sanger Centre is funded to complete the sequence of M. leprae  
 by the Helser Program for Research in Leprosy and Tuberculosis of  
 The New York Community Trust.  
 Work in Paris is supported by the Helser Trust, the Association  
 Française Raoul Follereau and the Groupement de Recherches et des  
 Etudes des Genomes (GIR-GRG).  
 Details of M. leprae sequencing at the Sanger Centre are available  
 on the World Wide Web.  
 (URL, <http://www.sanger.ac.uk/Projects/>)  
 CDS are numbered using the following system eg MLCB33.01c. ML (M.  
 leprae), CB33 (cosmid name), .01 (first CDS), c (complementary  
 strand).

The more significant matches with motifs in the PROSITE database  
 are also included but some of these may be fortuitous. The length  
 in codons is given for each CDS.  
 Usually the highest scoring match found by fasta -o is given for  
 CDS which show significant similarity to other CDS in the database.  
 The position of possible ribosome binding site sequences are given  
 where these have been used to deduce the initiation codon. All CDS  
 over 100 codons have been analysed. Gene prediction is based on  
 positional base preference in codons especially where there is an  
 increase in the observed/expected third position G + C. CAUTION:

We may not have predicted the correct initiation codon. Where

## FEATURES

## source

## gene

## CDS

possible we choose an initiation codon (atg, gtg, or tgg) which is  
 preceded by an upstream ribosome binding site sequence (optimally  
 5-13bp before the initiation codon). If this cannot be identified  
 we choose the most upstream initiation codon.  
 IMPORTANT: This sequence MAY NOT be the entire insert of the  
 sequenced clone. It may be shorter because we only sequence  
 overlapping sections once, or longer, because we arrange for a  
 small overlap between neighbouring submissions.

COMMENT
MAPPING: Clones were assigned to the YAC map by hybridization by
M. Lohli, Cold Spring Harbor Laboratories, and fingerprinted
by M. Marra, Washu, to pick the best candidates for sequencing.

NOTICE: This sequence may not be the entire insert of this clone.
It may be shorter because we only sequence overlapping sections
once, or longer because we provide a small overlap between
neighboring submissions.

This sequence was finished as follows unless otherwise noted:
all regions were double stranded or sequenced with an alternate
chemistry; an attempt was made to resolve all sequencing problems,
such as compressions and repeats; all regions were covered by
sequence from more than one subclone

NEIGHBORING COSMID INFORMATION:

The clone sequenced to the left is F5110. The actual start of this
clone is at base position 104960 of F5110; actual end is at base
position 91149 of F6N23.

NOTES:
Coding sequences below are predicted from computer analysis, using
the program GeneFinder(P. Green and L. Hillier, ms in preparation).

PT      Colon-specific nucleic acids - useful as probes for detecting colon
PT      cancer micrometastases
PS      Claim 15; Fig 5A-B; S1pp; English.
CC      V1668-81 represent polynucleotide sequences of partial or full-length
CC      cDNA clones of colon-specific genes. The polynucleotides can be used
CC      as probes to detect expression of the corresponding human genes, e.g. in
CC      diagnostic assays for detecting micrometastases of colon cancer.
CC      Recombinant cells containing the polynucleotides can be used to
CC      produce the polypeptides, in order that antibodies can be raised and
CC      used in further screening or diagnostics.

PT      Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT      for diagnosis of abnormal cell function, by preparing cDNA that
PT      reflects relative abundance of corresp. mRNA in specific human
PT      tissues
PS      Claim 1; Page 1138-1139; 2245pp; Japanese.
CC      A single-stranded DNA (or its complementary strand or the corresp.
CC      double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC      given in T19001-T26837 and which is able to hybridise to part of
CC      human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC      sequences were obtained from 3'-directed cDNA libraries prepared
CC      from various human tissues; synthesis of cDNA was initiated from the
CC      3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC      untranslated sequence is unique to a particular mRNA species, almost
CC      all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC      is constructed sp as to reflect accurately the relative abundance of

```

```

CC      different mRNAs in the particular tissue from which it was derived.
CC      The appearance frequency of a given GS in a cDNA library can be
CC      determined (esp. using primers and probes derived from the GS
CC      sequences) as a means of diagnosing abnormal cell function or for
CC      recognising different cell types.

PT Computer-readable medium with recorded Streptococcus pneumoniae
PT polynucleotide sequences - useful in diagnostic kits and assays, and
PT pharmaceutical compositions and vaccines for Streptococcus
PT pneumoniae
PS Claim 1: Page 257-269; 1409pp; English.
CC The present invention describes a computer readable medium which has
CC the nucleotide sequences SEQ ID NO:1 to 391 (VS2153 to VS2524) recorded
CC on it, or a representative fragment or a sequence at least 95% identical
CC to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1
CC to 391 (VS2153 to VS2524) are genomic fragments from Streptococcus
CC pneumoniae. The present invention also describes an isolated nucleic acid
CC molecule encoding a homologue of any of the fragments of the S.pneumoniae
CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced
CC by a process comprising: (a) screening a genomic DNA library using as a
CC probe a target sequence defined by any of the sequences in SEQ ID NO:1
CC to 391, identifying members of the library which contain sequences
CC that hybridise to the target sequence and isolating the nucleic acid
CC molecules from the members; or (b) isolating mRNA, DNA or cDNA produced
CC from an organism, amplifying nucleic acid molecules whose nucleotide
```

```
CC sequence is homologous to amplification primers derived from the
CC fragment of the S. pneumoniae genome to prime the amplification and
CC isolating the amplified sequences. The computer readable medium can be
CC used in a computer-based system for identifying fragments of the
CC S. pneumoniae genome of commercial importance, or expression modulating
CC fragments of the S. pneumoniae genome. Products from the present
CC invention can be used in diagnosis kits and assays, and pharmaceutical
CC compositions and vaccines for S. pneumoniae.

PT c-Jun NH2-terminal kinase (JNK)-interacting protein 1 - used to
PT treat neurodegenerative disease, blood clot, leukaemia, autoimmune
PT disease, and inflammation
PS Claim 1: Page 66-70; 95pp; English.
CC This cDNA sequence codes for murine JNK-interacting protein 1
CC (JIP-1, see W81625), a novel cytoplasmic anchor protein that
CC specifically binds to and inhibits the biological effects of JNK
CC (c-Jun NH2-terminal kinase), including the initiation of apoptosis
CC and oncogenic transformation. To isolate the clone, a yeast
CC two-hybrid method was used to screen a mouse embryo cDNA library to
CC identify proteins that interact with JNK. 7 overlapping partial
CC clones were isolated, and the full-length cDNA was subsequently
CC obtained by screening a mouse brain lambda ZAP1 cDNA library. The
CC invention provides JIP-1 nucleic acids and polypeptides, expression
CC vectors and host cells. The JIP-1 polypeptide and nucleic acids
CC (including antisense and ribozyme molecules) can be used in the
CC manufacture of a medicament for treating a pathological condition
CC associated with abnormal expression or activity of JNK, such as a
CC neurodegenerative disease (selected from Parkinson's disease and
CC Alzheimer's disease), a blood clot, stroke, malignancy, leukaemia,
CC an autoimmune disease or inflammation (all claimed).

PT New isolated Enterococcus faecalis polynucleotides and polypeptides  
PT - used to develop products for the detection of Enterococcus and for  
PT use in vaccines for prevention or attenuation of Enterococcus  
PT infection.  
PS Claim 1; Page 1739-1742; 2084pp; English.  
CC A computer readable medium has been developed which has recorded on it  
CC 982 nucleotide sequences isolated from the Enterococcus faecalis genome.  
CC X12938 to X13919 represent these nucleotide sequences which are primary  
CC nucleotide sequences, also known as contigs. The computer-based system  
CC can identify fragments of the Enterococcus faecalis genome with  
CC commercial importance. The products can be used to detect the presence  
CC of Enterococcus faecalis in samples. They can also be used for  
CC diagnosing Enterococcal infection in an animal and monitoring  
CC progression of disease, and for identifying agents which can be used to  
CC modulate the growth or pathogenicity of Enterococcus faecalis, or  
CC another related organism, in vivo or in vitro. In particular the  
CC polypeptides encoded by the Enterococcus faecalis nucleotide sequences  
CC can be used in vaccines to prevent or attenuate an Enterococcal  
CC infection.

PT New isolated Enterococcus faecalis polynucleotides and polypeptides  
PT - used to develop products for the detection of Enterococcus and for  
PT use in vaccines for prevention or attenuation of Enterococcus

PT infection.  
PS Claim 1; Page 939-949; 2084pp; English.

CC A computer readable medium has been developed which has recorded on it  
CC 982 nucleotide sequences isolated from the Enterococcus faecalis genome.  
CC X12938 to X13919 represent these nucleotide sequences which are primary  
CC nucleotide sequences, also known as contigs. The computer-based system  
CC can identify fragments of the Enterococcus faecalis genome with  
CC commercial importance. The products can be used to detect the presence  
CC of Enterococcus faecalis in samples. They can also be used for  
CC diagnosing Enterococcal infection in an animal and monitoring  
CC progression of disease, and for identifying agents which can be used to  
CC modulate the growth or pathogenicity of Enterococcus faecalis, or  
CC another related organism, in vivo or in vitro. In particular the  
CC polypeptides encoded by the Enterococcus faecalis nucleotide sequences  
CC can be used in vaccines to prevent or attenuate an Enterococcal  
CC infection.

e-mail: rounsley@tigr.org  
 BAC clone F26C24 is from Arabidopsis chromosome II and is near the  
 molecular marker m1398.  
 The orientation of the sequence is from SP6 to T7 end of the BAC  
 clone.  
 Genes were identified by a combination of three methods: Gene  
 prediction programs including GRAT (available by anonymous ftp  
 from arthur.epm.ornl.gov), Genefinder (Phil Green, University of  
 Washington), Genscan (Chris Burge/GENSCANW.html), and NetPlantGene  
 (http://www.cbs.dtu.dk/netgene/cbsnetgene.html), searches of the  
 complete sequence against a peptide database and the Arabidopsis  
 EST database at TIGR (http://www.tigr.org/tidb/at.html).  
 Annotated genes are named to indicate the level of evidence for  
 their annotation. Genes with similarity to other proteins are named  
 after the database hits. Genes without significant peptide  
 similarity but with EST similarity are named as 'unknown' proteins.  
 Genes without protein or EST similarity, that are predicted by more  
 than two gene prediction programs over most of their length are  
 annotated as 'hypothetical' proteins. Genes encoding tRNAs are

FEATURES  
 source predicted by tRNAscan-SE (Sean Eddy,  
<http://genome.wustl.edu/eddy/tRNAscan-SE/>). Simple repeats are  
 identified by RepeatMasker (Arian Smit,  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>). Regions of  
 genomic sequence that are not annotated as genes but have predicted  
 exons by GRAT are annotated as misc features.

COMMENT

CLONE LENGTH: This sequence does not necessarily represent the  
 entire insert of this clone. Overlapping regions of clones are only  
 sequenced and submitted once, so the sequence for the remainder of  
 the insert may be found in the record for the adjacent clones.  
 Overlapping clones are noted at the beginning and end of the  
 Features listing.

#### ANNOTATION OF FEATURES:

STSs are identified using ePCR (Genome Res. 7:541-550) searches  
 of a local database that includes entries from dbSTS, GDB, and  
 local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green,  
 unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST  
 (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the  
 EST and cDNA sequences. Genes demonstrate at least two exons  
 flanked by consensus splice sites that maintained sequence

continuity across the splice junctions. Sequences that are not  
 identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum  
 standard of double strand coverage with a minimum of 2 clones and 2  
 reads with no ambiguities or 2 chemistries with a minimum of 2  
 clones and 3 reads with no ambiguities. If the sequence quality for  
 a region does not meet this standard, it will be indicated in the  
 annotation as low coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality  
 standards - estimated error rate less than 1 per 10,000 bases.  
 Reports of lowest quality individual bases and measures of base  
 quality are listed below. Description of the metrics can be found  
 at URL: <http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html>.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

PT New isolated human genes and the secreted polypeptide(s) they encode  
PT - useful for diagnosis and treatment of e.g. cancers, neurological  
PT disorders, immune diseases, inflammation or blood disorders  
PT  
PS Claim 1: Page 399-400; 721pp; English.  
CC This sequence represents a nucleic acid molecule designated gene 161 from  
CC the human cDNA clone HAWBA28 (deposited as clone ATCC 97903 and ATCC  
CC 208049) which encodes a secreted human protein. The gene can be used to  
CC generate fusion proteins by linking to the gene to a human immunoglobulin  
CC Fc portion (e.g. V59502) for increasing the stability of the fused  
CC protein as compared to the human protein only.  
CC The invention relates to 186 novel genes and their fragments (nucleic  
CC acid sequences: V59511-V59812; amino acid sequences W74731-W75025) which  
CC are useful for preventing, treating or ameliorating medical conditions  
CC e.g. by protein or gene therapy. Also, pathological conditions can be  
CC diagnosed by determining the amount of the new polypeptides in a sample  
CC or by determining the presence of mutations in the new polynucleotides.  
CC Specific uses are described for each of the 186 polynucleotides, based on  
CC which tissues they are most highly expressed in (see V59511 for described  
CC uses).

PT	DNA comprising endothelin-1 promoter elements - for expression of
PT	heterologous genes in vascular endothelial cells, esp. for gene
PT	therapy
PS	Claim 1; Figure 1A; 15pp; English.
CC	The promoter element is capable of directing high-level, cell-
CC	specific expression of an operably linked heterologous gene. The
CC	promoter may be used for gene therapy and drug delivery for vascular
CC	and cardiovascular diseases by expression of proteins involved in
CC	thrombolysis, thrombolysis, inflammation, immunomodulation, etc. It
CC	may also be used in transgenic animal studies of human diseases.

 PT Chimeric gene conty. therapeutic gene linked to HREE - partic. for  
 PT expressing SOD etc. in hypoxic tissue to reduce tissue injury caused  
 PT by ischaemia or reperfusion  
 PS Example 1: Page 48, 118pp; English.  
 CC Expression of pGL3-1700, contg. the human endothelin-1 (ET-1)  
 CC gene promoter (T31013), in transfected human arterial endothelial  
 CC cells was increased approx. 5-fold by induction of the cells in  
 CC a hypoxic atmosphere. No hypoxia-induced increase in expression  
 CC was seen in HeLa cells, C2C12 cells or cardiac myocytes. The  
 CC promoter may be used to target hypoxia-regulated genes specifically  
 CC to cells of the vascular endothelium, since it contains elements  
 CC conferring tissue specificity as well as hypoxia response enhancer  
 CC elements able to up-regulate transcription of a (therapeutic) gene  
 CC under hypoxic conditions.

 PT Expression augmenting sequence elements - used in vectors for  
 PT expressing recombinant proteins at high levels in shorter periods of  
 PT time  
 PS Claim 1: Page 23-30; 36pp; English.  
 CC A 14507 bp DNA sequence (T73568) comprises a novel transcription  
 CC regulatory element, expression augmenting sequence element (EASE),  
 CC that facilitates high expression of recombinant proteins in  
 CC mammalian host cells. It was identified by cloning the integration  
 CC site of a unique expression cassette encoding recombinant dimeric  
 CC tumour necrosis factor receptor-immunoglobulin Fc fusion protein  
 CC from genomic DNA of a CHO 245-3 cell line expressing this protein  
 CC at a high level. Expression vectors incorporating an EASE show  
 CC a 2- to 8-fold improvement of recombinant protein expression levels  
 CC in CHO host cells. The EASE sequence also facilitates high  
 CC expression in shorter periods of time.

 PT New composition containing an aerosolized antisense ET-1 molecule -  
 PT useful for treating pulmonary hypertension  
 PS Disclosure; Fig 1: 37pp; English.  
 CC The invention relates to a method for treating pulmonary hypertension by  
 CC delivering a therapeutic composition, comprising an aerosolised antisense

CC endothelin-1 (ET-1) molecule, to the lungs of a patient. The composition  
 CC can be used in a method for determining the efficacy of the treatment for  
 CC e.g. when studying molecules and observing the effects of the composition  
 CC on an animal model system hypersensitive to antisense ET-1. The method is  
 CC useful for treating pulmonary hypertension. The aerosolised antisense  
 CC ET-1 molecule permits inhibition of the ET-1 transcription, which  
 CC relieves pulmonary hypertension. Its use avoids side effects caused by  
 CC alternative therapies. The present sequence represents the genomic DNA  
 CC sequence of human ET-1 gene.

PT New recombinant DNA encoding plant phosphoglycerate mutase or its  
PT antigenic epitope(s) - useful for diagnosis or treatment of  
PT allergies to pollen and plant-derived foods  
PS Claim 1: Fig 1; 160p; German.  
CC T86242 encodes birch pollen co-factor-independent phosphoglycerate  
CC mutase (PGM-1). PGM-1 is a highly conserved plant allergen (panallergen)  
CC which can cause cross-reactivity in patients allergic to pollen and  
CC plant-derived foods. PGM-1 and its B cell and T cell epitopes can be  
CC used for the in vitro detection of allergy against PGM-1, by measuring  
CC serum IgE or a cellular reaction. They can also be used in immunotherapy  
CC and will not cause an autoimmune response because PGM-1 is significantly  
CC different from the human enzyme, which is co-factor dependent.

PT Computer-readable medium with recorded Streptococcus pneumoniae  
PT polynucleotide sequences - useful in diagnostic kits and assays, and  
PT pharmaceutical compositions and vaccines for Streptococcus  
PT pneumoniae  
PS Claim 1: Page 651-660; 1409pp; English.  
CC The present invention describes a computer readable medium which has  
CC the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded  
CC on it, or a representative fragment or a sequence at least 95% identical  
CC to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1  
CC to 391 (V52134 to V52524) are genomic fragments from Streptococcus  
CC pneumoniae. The present invention also describes an isolated nucleic acid  
CC molecule encoding a homologue of any of the fragments of the S.pneumoniae  
CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced  
CC by a process comprising: (a) screening a genomic DNA library using as a  
CC probe a target sequence defined by any of the sequences in SEQ ID NO:1  
CC to 391, identifying members of the library which contain sequences  
CC that hybridize to the target sequence and isolating the nucleic acid  
CC molecules from the members; or (b) isolating mRNA, DNA or cDNA produced  
CC from an organism, amplifying nucleic acid molecules whose nucleotide  
CC sequence is homologous to amplification primers derived from the  
CC fragment of the S. pneumoniae genome to prime the amplification and  
CC isolating the amplified sequences. The computer readable medium can be  
CC used in a computer-based system for identifying fragments of the  
CC S. pneumoniae genome of commercial importance, or expression modulating  
CC fragments of the S. pneumoniae genome. Products from the present  
CC invention can be used in diagnosis kits and assays, and pharmaceutical  
CC compositions and vaccines for S. pneumoniae.

 e-mail: kline@tigr.org  
 BAC clone T23015 is from Arabidopsis chromosome II and is near the  
 molecular marker RNS1.  
 The orientation of the sequence is from SP6 to T7 end of the BAC  
 clone.

Genes were identified by a combination of three methods: Gene  
 prediction programs including GRAL (available by anonymous ftp  
 from [atthir.ebm.ornl.gov](http://atthir.ebm.ornl.gov)), GeneFinder (Phil Green, University of  
 Washington), Genscan (Chris Burge,  
<http://genomic.stanford.edu/~chris/GENSCANW.html>), and NetPlantGene  
 (<http://www.cbs.dtu.dk/netgene/cbsnetgene.html>). Searches of the  
 complete sequence against a peptide database and the Arabidopsis  
 EST database at TIGR (<http://www.tigr.org/tdb/at.html>).  
 Annotated genes are named to indicate the level of evidence for  
 their annotation. Genes with similarity to other proteins are named  
 after the database hits. Genes without significant peptide  
 similarity but with EST similarity are named as 'unknown' proteins.  
 Genes without protein or EST similarity that are predicted by more  
 than two gene prediction programs over most of their length are  
 annotated as 'hypothetical' proteins. Genes encoding tRNAs are  
 predicted by tRNAscan-SE (Sean Eddy,  
<http://genome.mustl.edu/eddy/tRNAscan-SE/>). Simple repeats are  
 identified by repeatmasker (Arian Smit,  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>). Regions of  
 genomic sequence that are not annotated as genes but have predicted  
 exons by GRAL are annotated as misc features.

Direct Submission  
Submitted (03-AUG-1998) E-mail enquiries: humquersanger.ac.uk  
Clone requests: clonerequestsanger.ac.uk  
On Jul 30, 1998 this sequence version replaced g1:3319855.  
During sequence assembly data is compared from overlapping clones.  
Where differences are found these are annotated as variations  
together with a note of the overlapping clone name. Note that the  
variation annotation may not be found in the sequence submission  
corresponding to the overlapping clone, as we submit sequences with  
only a small overlap as described above.  
This sequence is the entire insert of clone 929C8. The true right  
end of clone d11172A22 is at 36176 in this sequence. This sequence  
has been finished according to sequence map criteria as follows. An  
attempt is made to resolve all sequencing problems, such as  
compressions and repeats, but not necessarily within known  
annotated human repeat sequence elements (e.g. Alu). Where the  
sequence is ambiguous, there is an annotation using the 'unsure'  
feature key.  
This sequence was generated from part of bacterial clone contigs of  
human chromosome 22, constructed by the Sanger Centre Chromosome 22  
Mapping Group. Further information can be found at  
http://www.sanger.ac.uk/HGP/Chr22  
929C8 is from the human BAC library described in U-J. Kim et al.  
(1996) Genomics 34, 213-218. VECTOR: pBeloBAC11.

TITLE      Direct Submission
JOURNAL    Submitted (09-JUN-1999) Sanger Centre, Hinxton, Cambridgeshire,
            CB10 1SA, UK. E-mail enquiries: humquerry@sanger.ac.uk
            Requests: clonerequests@sanger.ac.uk
            On Jun 1, 1999 this sequence version replaced gi:4757070.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em.; EMBL; SW.; SWISSPROT; Tr.; TREMBL
            This sequence is the entire insert of clone 437116. This sequence
            has been finished according to sequence map criteria as follows. An
            attempt is made to resolve all sequencing problems, such as
            compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.

This sequence was generated from part of bacterial clone contigs of
human chromosome 1, constructed by the Sanger Centre Chromosome 1
Mapping Group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr1
437116 is from the library RPCI3 constructed at the Roswell Park
Cancer Institute by the group of Pieter de Jong. For further
details see http://bacpac.med.buffalo.edu/VECTOR: pCRPC2.

```

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION: This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by David Bentley's chromosome X mapping group at the Sanger Centre, Wellcome Trust Genome Campus, Hinxton, UK. Further information can be found at <http://www.sanger.ac.uk/HGP/chrX>

SOURCE INFORMATION: This clone was derived from human PAC library RPI-1 prepared by Pieter de Jong and coworkers at Roswell Park Cancer Institute, using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from one male donor. For further details, see <http://bacpac.med.buffalo.edu/>. The clone is available from Genome Systems, Inc. (<http://www.genomesystems.com>). VECTOR: pCYPAC2

NEIGHBORING SEQUENCE INFORMATION:

The actual start of this clone is at base position 1 of DJ0205E24;  
actual end is at 173452 of DJ0205E24. The orientation of this clone  
is unknown.

This clone contains STS SWXD2788 (NTD:g1256092).

COMMENT  
 \* NOTE: This is a 'working draft' sequence. It currently  
 \* consists of 3 contigs. The true order of the pieces  
 \* is not known and their order in this sequence record is  
 \* arbitrary. Gaps between the contigs are represented as  
 \* runs of N, but the exact sizes of the gaps are unknown.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.

1 1496: contig of 1496 bp in length  
 \* 1497 1513: gap of unknown length  
 \* 1514 72532: contig of 71019 bp in length  
 \* 72533 72549: gap of unknown length  
 \* 72550 188682: contig of 116133 bp in length.

PT Human colon specific genes and their expression products - detection
PT of which, in non-colon tissue samples, can be used as indication of
PT colon cancer metastasis
PS Claim 1; Fig 5; 60pp; English.
CC 13 CDNA clones (T45880-92), most of them partial clones, correspond
CC to human colon specific genes, designated CSG1, CSG2, etc., that
CC are primarily expressed in tissues derived from the colon. CSG7
CC and CSG10 show reduced expression in colon cancer cells as compared
CC to that in normal cells; the remaining genes are overexpressed in
CC colon cancer. The partial cDNA sequences can be used to isolate
CC full-length clones and genomic clones including the complete gene.
CC CSG nucleic acids can be used to produce CSG polypeptides (see also
CC W06545-53) in transformed host cells, as probes to detect disorders
CC of the colon, partic. colon cancer and colon cancer metastasis, and
CC in gene therapy.

PI Agents for targeting mesothelin, a tumour cell antigen - used for  
PI the detection or inhibition of growth of e.g. mesotheliomas, ovarian  
PI cancers and squamous cell carcinomas

PS Claim 16; Page 58-60; 72pp; English.  
CC This cDNA clone codes for CAK1 antigen (see W26674) which is  
CC found on mesothelium, mesotheliomas, ovarian cancers and some  
CC squamous cell carcinomas. The antigen has been designated  
CC mesothelin. The clone was isolated from a HeLa S3 cDNA library by  
CC screening with monoclonal antibody K1, previously shown to react  
CC with an antigen on human ovarian tumour OVCAR-3 cells. A 40 kDa  
CC form (K1) of mesothelin appears to be derived from the 69 kDa  
CC precursor by several processing steps. A claimed method for  
CC specifically delivering an effector molecule to a tumour cell  
CC bearing an antigen comprising at least 10 contiguous amino acids  
CC of mesothelin involves: (a) providing a chimeric molecule comprising  
CC the effector molecule attached to a targeting molecule that  
CC specifically binds to mesothelin; and (b) contacting the tumour with  
CC the chimeric molecule such that the chimeric molecule specifically  
CC binds to a tumour cell. Also claimed is a method for inhibiting  
CC mesothelin expression or activity by contacting mesothelin bearing  
CC cells with inhibitory nucleic acids for the mesothelin gene. The  
CC methods can be used to detect tumour cells and to inhibit the  
CC growth of cells bearing mesothelin. Mesothelin-derived antigens  
CC may be used in vaccines for the inhibition or prevention of  
CC mesotheliomas or ovarian tumours. DNA encoding the mesothelin  
CC antigen can be transfected into a mammal containing tumour cells to  
CC screen for drugs useful in cancer treatment. Antisense  
CC oligonucleotides can be used to inhibit mesothelin expression.  
CC (All claimed).

PT New fungus lacking functional Area and extracellular protease  
PT gene(s) - for high yield expression of industrial or therapeutic  
PT proteins, also new protease(s) from Aspergillus oryzae  
PS Example 1; Page 31-33; 80pp; English.  
CC This DNA sequence includes a coding region for the aspartic-type  
CC protease Pepc (see W31628) of Aspergillus oryzae. The pepc gene  
CC was cloned by cross-hybridisation with the Aspergillus niger pepc  
CC gene. The invention relates to a new fungus in which: (a) the area  
CC gene (see T97394) has been modified by recombinant DNA methods so  
CC that it cannot express a functional Area activator; and (2) the  
CC extracellular protease pepc (see T97393) and/or pepc genes are  
CC inactivated so that functional enzyme is not produced. The  
CC fungi have complete or partial deletions of the appropriate genes,  
CC or expression sequences that regulate the genes. Alternatively,  
CC the genes are inactivated by antisense mechanisms or by gene  
CC replacement. The new fungi are used for the recombinant production  
CC of industrial or therapeutic peptides and proteins, particularly  
CC enzymes (e.g. proteases, lipase, cellulase or chymosin),  
CC insulin, growth hormone, glucagon, somatostatin, interferon,  
CC platelet-derived growth factor, factor VII, factor VIII, urokinase,  
CC tissue plasminogen activator, erythropoietin or thrombopoietin.  
CC The new fungi do not produce protease and so provide higher yields  
CC of recombinant protein because of reduced proteolytic degradation of  
CC the isolated pepc and pepc genes can also be used for production of  
CC recombinant pep proteases.

PT Therapeutic delivery system utilizing bacterial invasin protein - is

PT not readily degraded in the gut, enhances systemic bio-availability

PT of therapeutic agents

PS Example 1: Fig 1: 110pp; English.

CC The sequence encodes a bacterial invasin protein, which may be

CC complexed with a therapeutic agent to transport the agent across the

CC gastrointestinal membrane barrier by transcytosis to increase

CC bioavailability 5- to 100-fold. The agent and bacterial protein may

CC be linked via a degradable peptide sequence as a fusion protein.

CC The invasin protein gene may be fused with a maltose binding protein

CC gene (T27537) for expression of a fusion protein (R96209) which may

CC be purified easily by amylose affinity chromatography. The delivery

CC system allows improved transport across enterocytes and Peyer's patch

CC M-cells. The system is not prone to degradation in the gut or early

CC release of biologically active material, and eliminates the need

CC for parenteral administration.

PT Nucleic acid encoding mitogen-activated protein kinase homologue -

PT for production of recombinant protein, for treatment of

PT inflammation

PS Claim 2: Column 19-22; 19pp; English.

CC This cDNA sequence codes for SMAP (see W26578) a human MAP kinase

CC homologue that is involved in protective cell signalling processes.

CC It was identified and cloned using Incyte Clone No. 214915 from a

CC stomach cDNA library by PCR amplification (see T90353-54). Also

CC claimed are: an expression vector containing the polynucleotide

CC and a host cell transformed with the vector. The isolated

CC polynucleotide may be used for the production of recombinant SMAP,

CC which may be useful for drug screening, drug design, research,

CC antibody production, etc. The polynucleotide and SMAP, or its

CC variants, are especially used in the diagnosis and treatment of

CC activated or inflamed cells and/or tissues associated with the

CC expression of SMAP, especially for the diagnosis and treatment of

CC conditions that affect the stomach such as gastritis, ulcers, viral  
 CC and bacterial infections and neoplasms.

 PT Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - used  
 PT to isolate antimicrobial compounds, and in vaccines against S.  
 PT aureus infection  
 PS Claim 9: Page 642; 989pp; English.  
 CC The present sequence encodes a Staphylococcus aureus protein of  
 CC unknown function. The present sequence was isolated from a  
 CC library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA  
 CC sequence can be used in the construction of ribozymes and antisense  
 CC sequences to control the expression of Staphylococcal genes. The DNA  
 CC sequence is also useful as a source of regulatory elements for the  
 CC control of bacterial gene expression. The encoded protein may be used  
 CC to produce vaccines to enable a host to produce specific antibodies  
 CC with antibacterial action. These vaccines and antibodies would protect  
 CC a host against invasion by S. aureus, and conditions relating to  
 CC Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled  
 CC skin syndrome, and toxic shock syndrome.

 PT New stress-activated protein kinase 4 - useful in drug screening,  
 PT for, e.g. anti-inflammatory, anti-cancer and immuno-suppressing  
 PT agents  
 PS Claim 6: Fig 1; 119pp; English.  
 CC The present claimed sequence represents the human stress-activated  
 CC protein kinase 4 (SAPK4) cDNA isolated from a human pituitary gland  
 CC cDNA library. The invention claims that SAPK4 protein can be useful  
 CC in a screening assay for identifying agents that inhibit its activity  
 CC and/or agents that block its activation through stress activated kinase  
 CC kinase 3 (SKK3). Therefore, the agents identified in the assays may be  
 CC potentially useful for treating inflammatory diseases, e.g. rheumatoid  
 CC arthritis, asthma and psoriasis.

 PT pneumoniae  
 PS Claim 1: Page 781-790; 1409pp; English.  
 CC The present invention describes a computer readable medium which has  
 CC the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded  
 CC on it, or a representative fragment or a sequence at least 95% identical  
 CC to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1  
 CC to 391 (V52134 to V52524) are genomic fragments from Streptococcus  
 CC pneumoniae. The present invention also describes an isolated nucleic acid  
 CC molecule encoding a homologue of any of the fragments of the S.pneumoniae  
 CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced  
 CC by a process comprising: (a) screening a genomic DNA library using as a  
 CC probe a target sequence defined by any of the sequences in SEQ ID NO:1  
 CC to 391, identifying members of the library which contain sequences  
 CC that hybridise to the target sequence and isolating the nucleic acid

CC molecules from the members: or (b) isolating mRNA, DNA or cDNA produced  
CC from an organism, amplifying nucleic acid molecules whose nucleotide  
CC sequence is homologous to amplification primers derived from the  
CC fragment of the S. pneumoniae genome to prime the amplification and  
CC isolating the amplified sequences. The computer readable medium can be  
CC used in a computer-based system for identifying fragments of the  
CC S. pneumoniae genome of commercial importance, or expression modulating  
CC fragments of the S. pneumoniae genome. Products from the present  
CC invention can be used in diagnosis kits and assays, and pharmaceutical  
CC compositions and vaccines for S. pneumoniae.

 JOURNAL Use of an ordered cosmid library to deduce the genomic organization of Mycobacterium leprae  
 Mol. Microbiol. 7 (2), 197-206 (1993)  
 COMMENT 93188700  
 On Jun 28, 1997 this sequence version replaced gi:2222688.  
 Notes:  
 The Sanger Centre is funded to complete the sequence of M. leprae by the Helser Program for Research in Leprosy and Tuberculosis of The New York Community Trust.  
 Work in Paris is supported by the Helser Trust, the Association Francaise Raoul Follereau and the Groupement de Recherches et des Etudes des Genomes (GIP-GREG).  
 Details of M. leprae sequencing at the Sanger Centre are available on the World Wide Web.  
 (URL, http://www.sanger.ac.uk/projects/)  
 CDS are numbered using the following system eg MLCB33.01c. ML (M. leprae), CB33 (cosmid name), .01 (first CDS), c (complementary strand).  
 The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.  
 Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. All CDS over 100 codons have been analysed. Gene prediction is based on positional base preference in codons especially where there is an increase in the observed/expected third position G + C. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.  
 IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid L383 unknown.

AUTHORS Robison,K.
DIRECT SUBMISSION
Submitted (01-MAR-1994) Department of Genetics, Harvard Medical
School, 200 Longwood Avenue, Boston MA 02115
COMMENT On Mar 31, 1994 this sequence version replaced gi:414221.
This sequence data was produced by the Genome Sequencing Center
located at Collaborative Research Incorporated (1365 Main St.,
Waltham MA, 02159). 617-487-7979. Please contact Doug Smith
(smith@er.cric.com). The annotation should be considered
preliminary and incomplete.

Submitted (18-DEC-1998) European Schizosaccharomyces genome  
sequencing project, Sanger Centre, The Wellcome Trust Genome  
Campus, Hinxton, Cambridge CB10 1SA, E-mail: barrell@sanger.ac.uk  
and biotechnologische und molekularbiologische Forschung,  
Angelhofweg 39, D-69225 Mannheim, Germany  
Notes:  
Details of yeast sequencing at the Sanger Centre are available on  
the World Wide Web.  
(URL, [http://www.sanger.ac.uk/Projects/S\\_pombe/](http://www.sanger.ac.uk/Projects/S_pombe/))  
During 1995 to 1996 about 66% of S. pombe chromosome I was  
sequenced by the Sanger Centre. The sequencing of the S. pombe  
genome is now being continued with funding from The European  
Commission. Fourteen European sequencing laboratories, including  
the Sanger Centre, are participating in the project.  
Protein coding regions (CDS) have been predicted with the help of  
computer analysis using the GeneFINDER program in PomBase (an ACEDB

On Jun 4, 1997 this sequence version replaced g1:1929467.
The Staden databases, finishing information, and all
chromatographic files used in the assembly of this clone are
available from our anonymous ftp site.

All repeats were identified using RepeatMasker: Smit, A.F.A. &
Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

PT Human colon specific genes and their expression products - detection

of which, in non-colon tissue samples, can be used as indication of

colon cancer metastasis

PS Claim 1: Fig 5; 60pp; English.

CC 13 cDNA clones (743860-92), most of them partial clones, correspond

CC to human colon specific genes, designated CSG1, CSG2, etc., that

CC are primarily expressed in tissues derived from the colon. CSG7

CC and CSG10 show reduced expression in colon cancer cells as compared

CC to that in normal cells; the remaining genes are overexpressed in

CC colon cancer. The partial cDNA sequences can be used to isolate

CC full-length clones and genomic clones including the complete gene.

CC CSG nucleic acids can be used to produce CSG polypeptides (see also

CC W06545-53) in transformed host cells, as probes to detect disorders

CC of the colon, partic. colon cancer and colon cancer metastasis, and

CC in gene therapy.

PT Isolation of fibre-specific cotton promoter sequences - using

PT selected DNA probes to screen genomic DNA fragments, for production

PT of cotton fibres with improved characteristics

PS Claim 1; Column 59-62; 46pp; English.

CC Cotton fibre cell-specific promoter sequences were isolated by

CC differential screening of a cotton plant cDNA library. of 4788 clones

CC from a 10 day cell library screened with leaf cDNAs, 800 clones not

CC present in the leaf were isolated. These were screened with cDNAs from

CC ovule, root and flower mRNAs and resulted in 79 clones isolated. PCR

CC analysis was then used to remove cross-hybridising clones. This resulted

CC in the isolation of 18 cDNA clones specifically expressed in cotton fibre

CC cells (T30242-4 and T30253-67). These cDNAs were then used to screen for

CC homologous genomic sequences (T30245-53 and T30268) in order to obtain

CC the corresp. promoter sequences.

CC This genomic clone is derived from the 1.9 kb SalI-EcoRI fragment of the

CC sub-clone designated SKSIE6-H6-RI. This forms part of the genomic clone

CC designated as EMBL-SI-H6-4 which contains a 13 kb MboI insert.

CC The promoters isolated from the fibre cell-specific clones can be used to

CC generate transgenic cotton plants and lines producing fibres having

CC altered quantity and quality.

PT DNA constructs contg. truncated promoter sequence - for

PT fibre-specific gene expression in cotton plants

PS Claim 1; Column 61-64; 48pp; English.

CC T70031-38 are genomic DNA clones containing cotton fibre-specific

CC promoters. Claimed DNA constructs comprise a truncated promoter sequence

CC (from one of T70031-38) that promotes preferential gene expression in

CC plant fibre cells, a protein coding sequence not naturally associated

CC with the promoter sequence and a 3' termination sequence. The DNA

CC constructs are useful for expressing foreign genes in fibre-producing

CC plants, esp. to produce transgenic cotton plants with varied cotton fibre

CC characteristics and quality. The present sequence comprises a fragment of

CC pSIH6-4RI (an EcoRI fragment isolated from pKSIH6-4 which hybridises to

[illegible]

CC medicine, in vaccines to protect against Rickettsia, Ehrlichia,  
 CC Anaplasma and Coxiella species. The nucleic acids are also useful  
 CC as probes to identify related sequences, e.g. for identification of  
 CC organisms and for diagnosing infection. Use of nucleic acid  
 CC vaccines avoids the problem of protein purification associated with  
 CC protein-based vaccines. The nucleic acid does not replicate in the  
 CC host but remains episomal and capable of expressing polypeptide for  
 CC at least 19 mth.

PT Novel outer membrane proteins from Ehrlichia chaffeensis and  
 PT Ehrlichia canis

PS Disclosure; Fig 20A; 55pp; English.

CC The invention provides isolated outer membrane proteins (OMP) from  
 CC Ehrlichia chaffeensis and E. canis. The E. chaffeensis proteins form part  
 CC of the OMP family and consist of proteins OMP-1, -1(B to Z) shown

CC in Y06943-958. The E. canis proteins form part of the P30 family and  
 CC consist of proteins shown in Y06959-970. The proteins and genes are used

CC to detect E. chaffeensis in patients and E. canis in dogs.

PT New isolated Borrelia burgdorferi nucleic acids - used to develop  
 PT products for the detection, diagnosis, characterisation, prevention  
 PT and therapy of infections, particularly Lyme disease

PS Claim 1; Page 994-996; 112pp; English.

CC X20248 to X20402 represent polynucleotide sequences isolated from  
 CC Borrelia burgdorferi (Bb). Products derived from Bb can be used for

CC the detection, diagnosis, characterisation, prevention and therapy of

CC Bb infections, e.g. Lyme disease. They can also be used for the

CC production of biosynthetic products, e.g. enzymes. Borrelia belongs

CC to a family of motile, spiral-shaped bacteria called Spirochetes.

CC Spirochetes are pathogenic in humans and Borrelia causes epidemic and

CC endemic relapsing fever, and Lyme borreliosis, more commonly known as

CC Lyme disease.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.  
 PT for diagnosis of abnormal cell function, by preparing cDNA that

PT reflects relative abundance of corresp. mRNA in specific human

PT tissues

PS Claim 1; Page 677; 2245pp; Japanese.  
 CC A single-stranded DNA (or its complementary strand or the corresp.  
 CC double-stranded DNA) which comprises one of the 7837 "GS" sequences

CC given in T19001-726837 and which is able to hybridise to part of  
CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
CC sequences were obtained from 3'-directed cDNA libraries prepared  
CC from various human tissues; synthesis of cDNA was initiated from the  
CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
CC untranslated sequence is unique to a particular mRNA species, almost  
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library  
CC is constructed so as to reflect accurately the relative abundance of  
CC different mRNAs in the particular tissue from which it was derived.  
CC The appearance frequency of a given GS in a cDNA library can be  
CC determined (esp. using primers and probes derived from the GS  
CC sequences) as a means of diagnosing abnormal cell function or for  
CC recognising different cell types.

PT In vitro screening test for agents that inhibit Candida genes  
PT involved in virulence - and transition to hyphal form, potentially  
PT useful as antimycotic agents  
PS Disclosure: Fig 7; 79pp: English.  
CC The sequence is that encoding the CAC1A4 protein which can be used  
CC in the development of an in vitro screening test for compounds  
CC that inhibit biological activity of the protein and a system for  
CC measuring its activity. The protein is involved in virulence and  
CC hyphal formation. Inhibitors are potentially useful for rendering  
CC pathogenic fungi (any species in which hyphal induction by kinase  
CC occurs) avirulent and/or to treat inflammation. The coding sequence  
CC can be used as source of probes for detecting C. albicans in  
CC amplification or hybridisation assays, also to identify and  
CC clone homologous genes from other fungi.

PT New human retino-blastoma gene and polypeptide(s)  
PT - used for screening individuals for defective retino-blastoma  
PT gene and treating these patients.  
PS Disclosure: fig 6; 71 pp; English.  
CC DNA encoding human retinoblastoma (RB) gene exons and flanking regions.  
CC The cDNA (see P90599 and N90490) can be used to screen individuals  
CC for the presence of the mutated RB gene. The RB polypeptide  
CC can prevent retinoblastoma formation, and corresp. antibodies  
CC can be used in tumour immunodiagnosis. Refer to patent for more  
CC sequence analysis details.

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus  
PT stored on computer readable medium and used in the production of  
PT anti-S.aureus vaccines  
PS Claim 1: Page 913-917; 3271pp; English.  
CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences  
CC of the invention. The DNA sequences are recorded on a computer readable  
CC medium, preferably selected from a floppy or hard disk, random access  
CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using  
CC the S.aureus DNA sequences allows putative functions to be assigned so  
CC that protein-encoding or regulatory regions of commercial, therapeutic or  
CC industrial importance can be obtained. Specifically, sequences which are  
CC likely to encode antigens have been identified and these polypeptides can  
CC be used in a vaccine composition against S.aureus infection. The  
CC polypeptides can also be used in a kit for the immunodetection of  
CC S.aureus in a sample. S.aureus is implicated in numerous human diseases,  
CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,  
CC skin and surgical wound infections, scalded skin syndrome, toxic shock  
CC syndrome, etc. Organisms transformed with the DNA sequences can be used  
CC for recombinant production of the polypeptides. The new DNA sequences  
CC (and their fragments) are useful as primers or probes for isolating  
CC homologues of any of the S.aureus DNA sequences contained on the  
CC computer readable medium.

PT New isolated Borrelia burgdorferi nucleic acids - used to develop
PT products for the detection, diagnosis, characterisation, prevention
PT and therapy of infections, particularly Lyme disease
PS Claim 1; Page 738-800; 1128bp; English.
CC X20248 to X20402 represent polynucleotide sequences isolated from
CC Borrelia burgdorferi (BD). Products derived from BD can be used for
CC the detection, diagnosis, characterisation, prevention and therapy of
CC Bb infections, e.g. Lyme disease. They can also be used for the
CC production of biosynthetic products, e.g. enzymes. Borrelia belongs
CC to a family of motile, spiral-shaped bacteria called Spirochetes.
CC Spirochetes are pathogenic in humans and Borrelia causes epidemic and
CC endemic relapsing fever, and Lyme borreliosis, more commonly known as
```

```
CC Lyme disease.

On Jun 13, 1998 this sequence version replaced g1:3212842.  
Address all correspondence to: Mark Adams The Institute for Genomic  
Research 9712 Medical Center Dr, Rockville, MD 20850, USA e-mail  
address: mdadams@tigr.org. The orientation of the sequence is  
from Sp6 end to 3' end. Genes were identified by a combination of  
five methods including: XGRAIL (available by anonymous ftp from  
arthur.epm.ornl.gov), GeneFinder (Phil Green, University of  
Washington), GenScan (Chris Burge,  
http://genomic.stanford.edu/~chris/GENSCANW.html) searches of the  
complete sequence against a peptide database, and the Human gene  
index database at TIGR (http://www.tigr.org/tgd/hgi.html).  
Genes without peptide homology having spliced EST hits are termed  
'Unknown gene product'. Genes encoding tRNAs are predicted by  
tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).

 AUTHORS Howden, P.  
 TITLE Direct Submission  
 JOURNAL Submitted (09-JUN-1999) Sanger Centre, Hinxton, Cambridgeshire,  
 CB10 1SA, UK. E-mail enquiries: humquerry@sanger.ac.uk  
 On Jun 1, 1999 this sequence version replaced gi:4741573.  
 During sequence assembly data is compared from overlapping clones.  
 Where differences are found these are annotated as variations  
 together with a note of the overlapping clone name. Note that the  
 variation annotation may not be found in the sequence submission  
 corresponding to the overlapping clone, as we submit sequences with  
 only a small overlap as described above.

## FEATURES

The following abbreviations are used to associate primary accession  
 numbers given in the feature table with their source databases:  
 Emi, EMBL; Swi, SWISSPROT; Tr, TREMBL  
 IMPORTANT: This sequence is not the entire insert of clone 86H19.  
 It may be shorter because we only sequence overlapping sections  
 once, or longer because we arrange for a small overlap between  
 neighbouring submissions.  
 The true right end of clone dJ428A13 is at 100 in this sequence.  
 This sequence has been finished according to sequence map criteria  
 as follows. An attempt is made to resolve all sequencing problems,  
 such as compressions and repeats, but not necessarily within known  
 annotated human repeat sequence elements (e.g. Alu). Where the  
 sequence is ambiguous, there is an annotation using the 'unsure'  
 feature key.  
 This sequence was generated from part of bacterial clone contigs of  
 human chromosome X, constructed by the Sanger Centre Chromosome X  
 Mapping Group. Further information can be found at  
 http://www.sanger.ac.uk/HGP/ChrX  
 86H19 is from the library RPi6 constructed at the Roswell Park  
 Cancer Institute by the group of Pieter de Jong. For further  
 details see http://bacpac.med.buffalo.edu/VECTOR: pPi6.

http://genome.wustl.edu/gsc  
mailto:saplense@wustl.edu

NOTICE: This sequence may not represent the entire insert of this  
clone. It may be shorter because we only sequence overlapping  
clone sections once, or longer because we provide a small overlap  
between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:  
all regions were double stranded or sequenced with an alternate  
chemistry; an attempt was made to resolve all sequencing problems,  
such as compressions and repeats; all regions were covered by  
sequence from more than one subclone; and the assembly was  
confirmed by restriction digest.

## MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. John D.  
McPherson, Department of Genetics, Washington University School of  
Medicine, St. Louis MO.

## SOURCE INFORMATION:

This clone is from the first BAC library from Genome Systems, Inc.  
(http://www.genomesystems.com).  
Cell line: lymphoblastoid  
Haplotypes: two  
VECTOR: pBelobAC  
Selection: chloramphenicol

## NEIGHBORING SEQUENCE INFORMATION:

The actual start of this clone is at base position 1 of GS039E22;  
actual end is at 143875 of GS039E22. The orientation of this clone

```

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

PT	Human colon specific genes and their expression products - detection						
PT	of which, in non-colon tissue samples, can be used as indication of						
PT	colon cancer metastasis						
PS	Claim 1; Fig 5; 60pp; English.						
CC	13 CDNA clones (T45880-92), most of them partial clones, correspond						
CC	to human colon specific genes, designated CSG1, CSG2, etc., that						
CC	are primarily expressed in tissues derived from the colon. CSG7						
CC	and CSG10 show reduced expression in colon cancer cells as compared						
CC	to that in normal cells; the remaining genes are overexpressed in						
CC	colon cancer. The partial cDNA sequences can be used to isolate						
CC	full-length clones and genomic clones including the complete gene.						
CC	CSG nucleic acids can be used to produce CSG polypeptides (see also						
CC	W06545-53) in transformed host cells, as probes to detect disorders						
CC	of the colon, partic. colon cancer and colon cancer metastasis, and						
CC	in gene therapy.

 PT Colon-specific nucleic acids - useful as probes for detecting colon  
 PT cancer micrometastases  
 PS Claim 15; Fig 5A-B; 51pp; English.  
 CC V16668-81 represent polynucleotide sequences of partial or full-length  
 CC cDNA clones of colon-specific genes. The polynucleotides can be used  
 CC as probes to detect expression of the corresponding human genes, e.g. in  
 CC diagnostic assays for detecting micrometastases of colon cancer.  
 CC Recombinant cells containing the polynucleotides can be used to  
 CC produce the polypeptides, in order that antibodies can be raised and  
 CC used in further screening or diagnostics.

 PT Oestrogen-regulated p171 gene and deduced polypeptide - useful for  
 PT predicting the propensity for metastatic spread or the  
 PT responsiveness to endocrine treatment of breast tumour  
 PS Disclosure: Page 16-17; 27pp; English.  
 CC A cDNA clone (T33219) corresponding to a portion of the oestrogen-  
 CC regulated human p171 gene was extended (T33220) using a primer  
 CC directed cloning strategy. p171 is a candidate for the hormonal  
 CC regulation of tumour invasion of breast cancer, a prognostic marker  
 CC of metastatic spread, and a suitable target for therapeutic  
 CC intervention by antihormones and antibody-directed methods. It is  
 CC significantly associated with oestrogen-dependent (ER+) disease.  
 CC The polypeptide (R88004) encoded by the cDNA contains 3 immunogenic  
 CC regions.

 PT Assessment of metastatic risk or oestrogen responsiveness in breast  
 PT cancer - by detecting expression of p171 protein  
 PS Disclosure: Column 11-14; 11pp; English.  
 CC This sequence represents a partial sequence of the p171 gene. This  
 CC sequence extends further in the 3' direction than the p171 partial  
 CC sequence shown in T39070. The protein encoded by this sequence is an  
 CC oestrogen regulated gene associated with breast cancer. The protein  
 CC encoded by this sequence can be used in the method of the invention. The  
 CC method is for determining the risk of metastasis of a female breast  
 CC tumour and predicting the responsiveness of a female breast  
 CC tumour to hormone treatment comprising determining if a tissue sample from the tumour  
 CC expresses a polypeptide comprising at least 14 continuous amino acids of  
 CC the protein encoded by this sequence. The method is useful for  
 CC determining the risk of metastasis of a female breast tumour and to  
 CC predict the response of the female breast tumour to hormone treatment.  
 CC p171 expression is highly predictive of tumour oestrogen receptor  
 CC expression and lymph node involvement.

PT      antigenic polypeptide(s) and antibodies, useful in diagnosing
PT      infections and prodn. of vaccines
PS      Claim 17: Page 42-43; 59pp; English.
CC      The consensus sequence for the unique region of the subgenomic RNA
CC      of human astrovirus serotype 2 is given in 075304. It comprises an
CC      1-nt 5' UTR; a 2388-nt ORF; and an 85 3' UTR (GenBank Data Library
CC      L06802). The single ORF encodes a 796 AA polypeptide with a
CC      predicted Mol. Mass of 88 kDa. At the amino terminus, the predicted
CC      polypeptide has a region of basic AAs that may play a role as a
CC      nucleic acid binding motif. At the carboxy terminus is a region of
CC      acidic AAs. See also 075302 CC on ORF 2.

PT      New nucleic acid from human astrovirus serotype 2 - and related
PT      antigenic polypeptide(s) and antibodies, useful in diagnosing
PT      infections and prodn. of vaccines
PS      Claim 1; Page 34-38; 59pp; English.
CC      Genomic RNA of H-Ast 2 is 6797 nts in length excluding the polyA
CC      tail (31 As). It is deposited (ATCC L13745). It has three
CC      overlapping reading frames (ORFs) (see FT). The 5' UTR which
CC      precedes ORF 1a is predicted to contain extensive secondary
CC      structure, as demonstrated by the characteristic stem-loop
CC      structures preceding the initiation AUG codon. ORF 1b overlaps ORF
CC      1a by 70 nts. It is in reading frame +1. Its first AUG codon is
CC      predicted to be weak. ORF 2, present also in the subgenomic RNA,
CC      overlaps ORF 1b by 5 nts. It encodes a capsid protein precursor of
CC      796 AAs with a predicted MW of 88 kDa. H-Ast 2 genomic RNA is claimed
CC      and so are the nucleic acid sequences and antigens of ORFs 1a, 1b
CC      and 2. When the overlap region of ORF 1a and 1b was examined, a
CC      ribosomal frameshift signal was identified, consisting of the
CC      'shift' heptanucleotide (AAAAAC) from posn. 2791-2797, followed
CC      by the stem-loop structure that may form a pseudoknot with a
CC      downstream sequence. The ribosomal frameshifting during
CC      translation of astrovirus RNA directs the synthesis of an ORF
CC      1a/1b fusion nonstructural polyprotein of 1416 AAs with a predicted
CC      Mol. mass of 161 kDa (see R67358). The predicted transmembrane
CC      alpha-helices occur at residues 156-172, 308-333, 343-362, and
CC      369-387, the predicted cleavage site at the N-terminus of the
CC      putative VPg-protease occurs at residues 419-420, the putative
CC      nuclear localisation signal occurs at residues 666-682, and fusion
CC      dipeptide (KK) occurs at residues 904-905. The ORF 1a/1b can be
CC      identified at nts 83-4329 of 075302. The minus 1 frameshift occurs
CC      at posn. 2794 of the sequence. An isolated nucleic acid encoding
CC      ORF 1a/1b is given in 075303 where the minus 1 frame shift occurs
CC      at posn. 2712. Antigen 1a/1b is given in R67358.

PT          New DNA polymerase from Thermoaerobacter thermohydrosulfuricus -
PT          useful for strand displacement amplification, reverse transcription
PT          and sequencing
PS          Example 1: Page 48-49; 92pp; English.
CC          This DNA sequence encodes a novel thermostable DNA polymerase
CC          (W26605) of the thermophilic anaerobe Thermoaerobacter
CC          thermohydrosulfuricus. It was isolated from a subgenomic library
CC          using a DNA polymerase I-specific probe that had itself been
CC          generated using primers (see T90452-53) based on conserved regions
CC          of DNA polymerase I family members. A host cell comprising a
    
```

```
CC vector containing an isolated nucleic acid encoding DNA polymerase  
CC is claimed. The DNA polymerase can be used in claimed methods: (a)  
CC for strand displacement amplification (SDA) when used with a  
CC thermostable restriction enzyme; (b) for production of cDNA when  
CC used in conjunction with polymerase and deoxyribonucleotides; and  
CC (c) to provide reverse transcription activity in RT-PCR. Mutagenic  
CC methods have been used to generate exonuclease-deficient DNA  
CC polymerases (see W2606-07) suited for sequencing, SDA and CDNA  
CC preparation.

PT New immunogenic fragments of Leishmania antigens and related nucleic acid, vectors and host cells - are useful for diagnosis, prevention

PT and treatment of leishmaniasis, also to induce production of

PT interleukin-12 generally

PS Claim 4; Page 66-69; 134pp; English.

CC This sequence encodes a Leishmania antigen (LAg) of the invention,

CC designated M15. Compositions and vaccines containing the protein are

CC used to generate a protective or therapeutic immune response against the

CC Leishmania species donavani, chagasi, infantum, major, amazonensis,

CC braziliensis, panamensis, tropica or guyanensis. They can also be used

CC to detect infection (in a skin test). The compositions induce a humoral

CC and/or cellular response, specifically of Th1 type, particularly

CC including induction of interleukin-12 (IL-12) production. They may thus

CC be used more generally to treat any condition (e.g. bacterial, viral or

CC protozoal infection, or cancer) which responds to IL-12.

PT New nucleic acid - useful for detection and identification of genus

PT Allycyclobacillus microorganism(s)

PS Claim 8; Page 18-23; 37pp; Japanese.

CC The present sequence represents a new nucleic acid which encodes enzymes

CC which participate in the biosynthesis of Omega-cyclohexane fatty acid.

CC The nucleic acid is isolated from Allycyclobacillus acidocaldarius. The

CC present invention also describes primers and probes containing all or

CC part of the nucleic acid from Allycyclobacillus acidocaldarius. The

CC primers and probes may be used for detection and/or identification of a

CC microorganism of genus Allycyclobacillus. The method can detect and

CC identify Allycyclobacillus genus rapidly and easily.

PT New isolated Enterococcus faecalis polynucleotides and polypeptides

PT - used to develop products for the detection of Enterococcus and for

PT use in vaccines for prevention or attenuation of Enterococcus

PT infection.

PS Claim 1; Page 1586-1588; 2084pp; English.

CC A computer readable medium has been developed which has recorded on it

CC 982 nucleotide sequences isolated from the Enterococcus faecalis genome.

CC X12938 to X13919 represent these nucleotide sequences which are primary

CC nucleotide sequences, also known as contigs. The computer-based system

CC can identify fragments of the Enterococcus faecalis genome with

CC commercial importance. The products can be used to detect the presence

CC of Enterococcus faecalis in samples. They can also be used for

CC diagnosis of Enterococcal infection in an animal and monitoring

CC progression of disease, and for identifying agents which can be used to

CC modulate the growth or pathogenicity of Enterococcus faecalis, or

CC another related organism, in vivo or in vitro. In particular the

CC polypeptides encoded by the Enterococcus faecalis nucleotide sequences

CC can be used in vaccines to prevent or attenuate an Enterococcal

CC infection.

from arthur.epm.ornl.gov), GeneFinder (Phil Green, University of Washington), Genscan (Chris Burge, <http://genomic.stanford.edu/~chris/GENSCANW.html>), and NetPlantGene (<http://www.cbs.dtu.dk/netgene/cbsnetgene.html>), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (<http://www.tigr.org/tdb/at.html>). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, <http://genome.wustl.edu/eddy/tRNAscan-SE/>). Simple repeats are identified by RepeatMasker (Arian Smit, <http://ftp.genome.washington.edu/RM/RepeatMasker.html>). Regions of genomic sequence that are not annotated as genes but have predicted exons by GRail are annotated as misc features.

TITLE Direct Submission
JOURNAL Submitted (14-OCT-1998) Nematode Sequencing Project, Sanger Centre,
Hinxton, Cambridge CB10 1HQ, UK and Department of Genetics,
Washington University, St. Louis, MO 63110, USA. E-mail:
jesse.sanger.ac.uk or rvenematode.wustl.edu
On Sep 24, 1998 this sequence version replaced gi:2804161.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continues. The sequence may be
contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate
segments.
* NOTE: This is a 'working draft' sequence.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

TITLE	2.2 Mb of contiguous nucleotide sequence from chromosome III of C. elegans
JOURNAL	Nature 368 (6466), 32-38 (1994)
MEDLINE	94150718
COMMENT	Coding sequences below are predicted from computer analysis, using predictions from GeneFinder (P. Green, U. Washington), and other available information. For a graphical representation of this sequence and its analysis see:- <a href="http://webace.sanger.ac.uk/cgi-bin/display?db=wormacc&amp;class=Sequence&amp;object=M106">http://webace.sanger.ac.uk/cgi-</a> <a href="http://webace.sanger.ac.uk/cgi-bin/display?db=wormacc&amp;class=Sequence&amp;object=M106">bin/display?db=wormacc&amp;class=Sequence&amp;object=M106</a> Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note. IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring subclones. IMPORTANT: This sequence is not the entire insert of clone M106. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring subclisions. The true left end of clone M106 is at 1 in this sequence. The true right end of clone M106 is at 2020 in sequence Z36949. The true left end of clone F59E10 is at 39873 in this sequence. The start of this sequence (1..105) overlaps with the end of sequence A1031266. The end of this sequence (39873..39973) overlaps with the start of sequence Z36949.

## JOURNAL

Submitted (10-NOV-1997) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA  
 On Nov 10, 1997 this sequence version replaced g1:2538080.  
 The Staden databases, finishing information, and all chromatographic files used in the assembly of this clone are available from our anonymous ftp site.

## COMMENT

All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997)  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>.  
 Location/Qualifiers

AUTHORS Wilkinson,J.
TITLE Direct Submission
JOURNAL Submitted (01-MAY-1997) Sanger Centre, Hinxton, Cambridgeshire,
CB10 1SA, UK. E-mail enquiries: humquerry@sanger.ac.uk Clone
requests: clonerequests@sanger.ac.uk
COMMENT On May 14, 1997 this sequence version replaced g1:1172969.
IMPORTANT: This sequence is the entire insert of clone 473J6. This
sequence was generated from part of bacterial clone contigs of
human chromosome X, constructed by the Sanger Centre chromosome X
mapping group. Further information can be found at
http://www.sanger.ac.uk/HGP/chrX/
This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
sequence is ambiguous, there is an annotation using the 'unsure'
feature key.
The true left end of clone 473J6 is at 1 in this sequence. The true
right end of clone 473J6 is at 135686.
473J6 is from the library RPC13 constructed at the Roswell Park
Cancer Institute by the group of Pieter de Jong.
For further details see http://bacpac.med.buffalo.edu/.

RESULT 15
LOCUS HS849L7/c 128169 bp DNA PRI 16-DEC-1997
DEFINITION Human DNA sequence from PAC 849L7 on chromosome Xq21.
ACCESSION AL008987
NID 92695813
VERSION AL008987.1 GI:2695813
KEYWORDS Xq21.
SOURCE human.
ORGANISM Homo sapiens
Eukaryota; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria;
Primates; Catarrhini; Hominoidea; Homo.
1 (bases 1 to 128169)

## COMMENT

On Dec 18, 1997 this sequence version replaced g1:2624153. IMPORTANT: This sequence is the entire insert of clone 849L7. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variations annotated may not be found in the sequence submission corresponding to the overlapping clone as we submit sequences with only a small overlap as described above. This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre chromosome X mapping group. Further information can be found at <http://www.sanger.ac.uk/HGP/ChrX/>. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The true left end of clone 849L7 is at 1 in this sequence. The true right end of clone 849L7 is at 128169. 849L7 is from the library RPC15 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see <http://bacpac.med.buffalo.edu/>.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

e-mail: rwaterston@wustl.edu

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone

NEIGHBORING COSMID INFORMATION:

The 5' clone is T4B21, 200 bp overlap; 3' clone is T32N4. Actual start of this clone is at base position 58066 of T4B21; actual end is at 53778 of T1J1.

Base position 85555 to 85579 of the T1J1 submitted sequence is represented by PCR product from T1J1 genomic DNA only.

NOTES:

Coding sequences below are predicted from computer analysis, using the program GeneFINDER (P. Green and L. Hillier, ms in preparation).

      USA
      e-mail: rounsley@tigr.org
      BAC clone T25N22 is from Arabidopsis chromosome II and is near the
      molecular marker m1310.
      The orientation of the sequence is from SP6 to T7 end of the BAC
      clone.
      Genes were identified by a combination of three methods: Gene
      prediction programs including GRAFT (available by anonymous ftp
      from arthur.epm.cornl.gov), GeneFinder (Phil Green, University of
      Washington), GenScan (Chris Burge,
      http://genomic.stanford.edu/~chris/GENSCANW.html), and NetPlantGene
      (http://www.cds.dtu.dk/netgene/cdsnetgene.html), searches of the
      complete sequence against a peptide database and the Arabidopsis
      EST database at TIGR (http://www.tigr.org/tdb/at.html).
      Annotated genes are named to indicate the level of evidence for
      their annotation. Genes with similarity to other proteins are named
      after the database hits. Genes without significant peptide
      similarity but with EST similarity are named as 'unknown' proteins.
      Genes without protein or EST similarity, that are predicted by more
      than two gene prediction programs over most of their length are
      annotated as 'hypothetical' proteins. Genes encoding tRNAs are
      predicted by tRNAscan-SE (Sean Eddy,
      http://genome.msu.tl.edu/eddy/tRNAscan-SE/). Simple repeats are
      identified by RepeatMasker (Arjan Smit,
      http://ftp.genome.washington.edu/RM/RepeatMasker.html). Regions of
      genomic sequence that are not annotated as genes but have predicted
      exons by GRAFT are annotated as misc features.

JOURNAL  
Submitted (23-MAY-1998) Department of Genetics, Washington  
University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA  
COMMENT  
SUBMITTED BY: WOGSC  
Genome Sequencing Center  
Department of Genetics  
Washington University  
St. Louis MO 63108, USA  
http://genome.wustl.edu/gsc  
mailto:sapiens@watson.wustl.edu

NOTICE: This sequence may not represent the entire insert of this  
clone. It may be shorter because we only sequence overlapping  
clone sections once, or longer because we provide a small overlap  
between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:  
all regions were double stranded or sequenced with an alternate  
chemistry; an attempt was made to resolve all sequencing problems,  
such as compressions and repeats; all regions were covered by  
sequence from more than one subclone; and the assembly was  
confirmed by restriction digest.

#### MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping and  
sequencing collaboration between the NHGRI Chromosome 7 Mapping  
Project (Eric D. Green, Director), John D. McPherson in the  
Department of Genetics (Washington University), and the Washington  
University Genome Sequencing Center. For additional information  
about the map position of this sequence, see  
http://www.nhgri.nih.gov/DIR/CHB/CHR7, send  
mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu/gsc

#### SOURCE INFORMATION:

This clone was derived from human PAC library RPCI-4, prepared by  
Pieter de Jong and coworkers at Roswell Park Cancer Institute,  
using the method described by Ioannou et al., Nature Genetics  
6:84-9 (1994). The library is from one male donor. For further  
details, see http://bacpac.med.buffalo.edu/  
The clone is available from Genome Systems, Inc.  
(http://www.genomesystems.com).  
VECTOR: pCYPAC2

#### NEIGHBORING SEQUENCE INFORMATION:

The clone sequenced to the left is D00547C10. Actual start of this  
clone is at base position 1 of D0807C15; actual end is at 11752  
of D0807C15.

This clone contains STS SWS1919 (NID:g1113280).

This clone contains a transposon, which has been cut from the  
submitted sequence, from base 83390 to base 84661.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.  
PT for diagnosis of abnormal cell function, by preparing cDNA that  
PT reflects relative abundance of corresp. mRNA in specific human  
PT tissues  
PS Claim 1: Page 1138-1139; 2245pp; Japanese.  
CC A single-stranded DNA (or its complementary strand or the corresp.  
CC double-stranded DNA) which comprises one of the 7837 "GS" sequences  
CC given in T19001-T26837 and which is able to hybridise to part of  
CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
CC sequences were obtained from 3'-directed cDNA libraries prepared  
CC from various human tissues; synthesis of cDNA was initiated from the  
CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
CC untranslated sequence is unique to a particular mRNA species, almost  
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library  
CC is constructed so as to reflect accurately the relative abundance of  
CC different mRNAs in the particular tissue from which it was derived.  
CC The appearance frequency of a given GS in a cDNA library can be  
CC determined (esp. using primers and probes derived from the GS  
CC sequences) as a means of diagnosing abnormal cell function or for  
CC recognising different cell types.

 PT Human colon specific genes and their expression products - detection  
 PT of which, in non-colon tissue samples, can be used as indication of  
 PT colon cancer metastasis.  
 PS Claim 1: Fig 5; 60pp; English.  
 CC 13 cDNA clones (743880-92), most of them partial clones, correspond  
 CC to human colon specific genes, designated CSG1, CSG2, etc., that  
 CC are primarily expressed in tissues derived from the colon. CSG7  
 CC and CSG10 show reduced expression in colon cancer cells as compared  
 CC to that in normal cells; the remaining genes are overexpressed in  
 CC colon cancer. The partial cDNA sequences can be used to isolate  
 CC full-length clones and genomic clones including the complete gene.  
 CC CSG nucleic acids can be used to produce CSG polypeptides (see also  
 CC W06545-53) in transformed host cells, as probes to detect disorders  
 CC of the colon, partic. colon cancer and colon cancer metastasis, and  
 CC in gene therapy.

PT Complete genome sequence of methano-genic archaeon, Methanococcus  
PT jannaschii - useful in identification of M. jannaschii genome  
PT fragment  
PS Claim 13: Page 152-585; 614pp; English.  
CC The present sequence represents the complete 1.66-megabase pair genome  
CC sequence of the Methanococcus jannaschii circular chromosome. The  
CC present invention describes M. jannaschii open reading frames from the  
CC genome sequence. The invention also describes a computer based system  
CC for identifying fragments of the M. jannaschii genome that are  
CC homologous to target nucleotide sequences, comprising: (a) data storage  
CC means comprising the nucleotide sequence of the 1664976, 58407 or 16550  
CC bp sequence (see V21209, V21210 and V21211), or a nucleotide sequence at  
CC least 99.9% identical to it; (b) search means for comparing a target  
CC sequence to the nucleotide sequence of the data storage means to  
CC identify a homologous sequence, and (c) retrieval means for obtaining  
CC the homologous sequence. The method, which is based on whole genome  
CC random sequencing of an autotrophic archaeon M. jannaschii, the genome  
CC of which consists of 3 physically distinct elements, a large circular  
CC chromosome (the 1664976 bp sequence given in V21209), a large circular  
CC extra-chromosomal element (the 58407 bp sequence given in V21210), and a  
CC small circular extra-chromosomal element (the 16550 bp sequence given in  
CC V21211), can be used in the identification of M. jannaschii genome  
CC fragment.

 PT and antibodies, for treatment, prevention and diagnosis of Lyme  
 PT disease  
 PS Claim 1; Page 84-85; 114pp; English.  
 CC A cDNA library in lambda ZAPit was constructed from B. burgdorferi  
 CC N40 and screened with rabbit anti-serum against N40. 6 positive  
 CC clones, not contg. OspA, OspB or flagellin genes, were selected.

CC 1 of these contained the r5 gene (Q88833) that encoded a 21.8 kDa  
CC protein (R65633). The protein may be used in the development of  
CC multimeric vaccines.

PT Human colon specific genes and their expression products - detection
PT of which, in non-colon tissue samples, can be used as indication of
PT colon cancer metastasis
PS Claim 1: Fig 5; 60pp; English.
CC 13 cDNA clones (T45880-92), most of them partial clones, correspond
CC to human colon specific genes, designated CSG1, CSG2, etc., that
CC are primarily expressed in tissues derived from the colon. CSG7
CC and CSG10 show reduced expression in colon cancer cells as compared
CC to that in normal cells; the remaining genes are overexpressed in
CC colon cancer. The partial cDNA sequences can be used to isolate
CC full-length clones and genomic clones including the complete gene.
CC CSG nucleic acids can be used to produce CSG polypeptides (see also
CC W06545-53) in transformed host cells, as probes to detect disorders
CC of the colon, partic. colon cancer and colon cancer metastasis, and
CC in gene therapy.

PT Colon-specific nucleic acids - useful as probes for detecting colon
PT cancer metastases
PS Claim 15: Fig 5A-B: 51pp; English.
CC V16668-81 represent polynucleotide sequences of partial or full-length
CC cDNA clones of colon-specific genes. The polynucleotides can be used
CC as probes to detect expression of the corresponding human genes, e.g. in
CC diagnostic assays for detecting the micrometastases of colon cancer.
CC Recombinant cells containing the polynucleotides can be used to
CC produce the polypeptides, in order that antibodies can be raised and
CC used in further screening or diagnostics.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.  
PT for diagnosis of abnormal cell function, by preparing cDNA that  
PT reflects relative abundance of corresp. mRNA in specific human  
PT tissues  
PS Claim 1: Page 1138-1139; 2245pp; Japanese.  
CC A single-stranded DNA (or its complementary strand or the corresp.  
CC double-stranded DNA) which comprises one of the 7837 "GS" sequences  
CC given in 119001-176837 and which is able to hybridise to part of  
CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
CC sequences were obtained from 3'-directed cDNA libraries prepared  
CC from various human tissues; synthesis of cDNA was initiated from the  
CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
CC untranslated sequence is unique to a particular mRNA species, almost  
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library  
CC is constructed so as to reflect accurately the relative abundance of  
CC different mRNAs in the particular tissue from which it was derived.  
CC The appearance frequency of a given GS in a cDNA library can be  
CC determined (esp. using primers and probes derived from the GS  
CC sequences) as a means of diagnosing abnormal cell function or for  
CC recognising different cell types.

PT New isolated prostate-derived nucleic acids - used to develop  
PT products which may have cytokine, immune regulatory, haematopoiesis  
PT regulating, anti-inflammatory or tumour inhibition activity  
PS Claim 1: Page 228; 675pp; English.

CC X40438 to X40715 represent 5' expressed sequence tags (ESTs) for human  
CC secreted proteins expressed in prostate, and encode the proteins given in  
CC Y11176 to Y11937 respectively. The proteins given represent the signal  
CC peptide and an N-terminal fragment of a secreted protein. The nucleic  
CC acid sequences can be used for producing secreted human gene products.  
CC They can also be used to develop products for diagnosis and therapy. The  
CC proteins obtained may have cytokine activity, cell proliferation and  
CC differentiation activity, haematopoiesis regulating activity, tissue  
CC growth regulating activity, reproductive hormone regulating activity,  
CC chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,  
CC receptor/ligand activity, anti-inflammatory activity, tumour inhibition  
CC activity or other activities. The products can be used in forensic, gene  
CC therapy and chromosome mapping procedures. The sequences can also be used  
CC for obtaining corresponding promoter sequences. The nucleic acids  
CC encoding the signal peptides can be used for directing extracellular  
CC secretion of a polypeptide or the insertion of a polypeptide into a  
CC membrane, or importing a polypeptide into a cell.

PT Helicobacter pylori nucleic acid sequences and related
PT polypeptide(s) - useful for vaccines to treat or prevent H. pylori
PT infection, and to detect Helicobacter
PS Claim 9; Page 887-889; 1481pp; English.
CC The present sequence encodes a Helicobacter pylori cytoplasmic protein
CC that may be used in a vaccine to prevent or treat H. pylori
CC infection or to identify H. pylori polypeptide binding compounds,
CC useful as potential H. pylori life cycle activators or inhibitors.
CC The genomic sequence of H. pylori (ATCC 55679) was determined from
CC overlapping contigs generated by mechanically shearing the bacterial
CC DNA. The sequences were analysed for ORF of at least 180 nucleotides,

```

CC and the predicted coding regions defined by computer evaluation. To  
CC identify likely H. pylori antigens for vaccine development, the amino  
CC acid sequences predicted from various ORF were analysed for significant  
CC homology to other known or exported membrane proteins. Having identified  
CC and determined the sequences of interest, particular regions can be  
CC isolated from H. pylori by PCR amplification for recombinant polypeptide  
CC production, e.g. in E. coli hosts.

PT Complete genome sequence of methano-genic archaeon, Methanococcus

PT jannaschii - useful in identification of M. jannaschii genome  
PR fragment  
PS Claim 13; Page 152-585; 614pp; English.  
CC The present sequence represents the complete 1.66-megabase pair genome  
CC sequence of the Methanococcus jannaschii circular chromosome. The  
CC present invention describes M. jannaschii open reading frames from the  
CC genome sequence. The invention also describes a computer based system  
CC for identifying fragments of the M. jannaschii genome that are  
CC homologous to target nucleotide sequences, comprising: (a) data storage  
CC means comprising the nucleotide sequences of the 1664976, 58407 or 16550  
CC bp sequence (see V21209, V21210 and V21211), or a nucleotide sequence at  
CC least 99.9% identical to it; (b) search means for comparing a target  
CC sequence to the nucleotide sequence of the data storage means to  
CC identify a homologous sequence, and (c) retrieval means for obtaining  
CC the homologous sequence. The method, which is based on whole genome  
CC random sequencing of an autotrophic archaeon M. jannaschii, the genome  
CC of which consists of 3 physically distinct elements, a large circular  
CC chromosome (the 1664976 bp sequence given in V21209), a large circular  
CC extra-chromosomal element (the 58407 bp sequence given in V21210), and a  
CC small circular extra-chromosomal element (the 16550 bp sequence given in  
CC V21211), can be used in the identification of M. jannaschii genome

PT New nucleic acid sequences from Staphylococcus aureus WCHU29 -  
PT useful in vaccines and for treatment of bacterial infections of e.g.  
PT respiratory tract and central nervous system  
PS Claim 1; Page 69-70; 390pp; English.  
CC This sequence encodes a Staphylococcus aureus protein of unknown  
CC function, and represents a DNA sequence of the invention.  
CC The DNA sequences were isolated from Staphylococcus aureus WCHU29

CC (NCIMB 40771). Host cells containing the DNA sequences are used to  
CC produce polypeptides or fragments. The proteins are used in the treatment  
CC of disease, for inducing an immune response by administering them, to  
CC produce antibody and/or T-cell immune response. Antagonists of the  
CC proteins are used for the inhibition of bacterial polypeptides.  
CC Conditions which may be treated include bacterial infections, especially  
CC respiratory, cardiac, gastrointestinal, central nervous, eye, kidney,  
CC urinary tract, skin, bones and joints. The proteins can also be used to  
CC identify antimicrobial compounds which are broad spectrum antibiotics,  
CC especially useful in the treatment of H. pylori infection.

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus  
PT stored on computer readable medium and used in the production of  
PT anti-S. aureus vaccines  
PS Claim 1; Page 1287-1288; 3271pp; English.  
CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences  
CC of the invention. The DNA sequences are recorded on a computer readable  
CC medium, preferably selected from a floppy or hard disk, random access  
CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using  
CC the S. aureus DNA sequences allows putative functions to be assigned so  
CC that protein-encoding or regulatory regions of commercial, therapeutic or  
CC industrial importance can be obtained. Specifically, sequences which are  
CC likely to encode antigens have been identified and these polypeptides can  
CC be used in a vaccine composition against S. aureus infection. The

CC polypeptides can also be used in a kit for the immunodetection of  
CC S. aureus in a sample. S. aureus is implicated in numerous human diseases,  
CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,  
CC skin and surgical wound infections, scalded skin syndrome, toxic shock  
CC syndrome, etc. Organisms transformed with the DNA sequences can be used  
CC for recombinant production of the polypeptides. The new DNA sequences  
CC (and their fragments) are useful as primers or probes for isolating  
CC homologues of any of the S. aureus DNA sequences contained on the  
CC computer readable medium.

PT Novel DNA molecule - encoding Epi B, C, D, P or Q enzymes  
PS Claim 1; Fig 9; 52pp; English.  
CC This is the nucleotide sequence of the BgIII/HpaII fragment of the  
CC Staphylococcus epidermis plasmid pTn32 which contains open reading

CC frames for epia, epib, epic, epid, epip, epiq and epiy. The proteins  
CC encoded by these are valuable reagents potentially useful in the  
CC prepn. of novel proteins such as dehydroalanine, dehydrobutyline,  
CC meso-lanthionine, 3-methyl-lanthionine and S-(2-aminovalinyl)-D-cysteine.

PT Detecting Plasmodium infection from hybridisation with  
PT extrachromosomal element - providing genus or species specific  
PS Claim 15: Page 54-59; 120pp; English.  
CC This is the nucleotide sequence of one strand of the PSL-PL470  
CC gene of the 30.7 kb extrachromosomal plasmid of plasmodium berghei.  
CC This plasmid encodes organelle-like rRNAs, tRNAs, ribosomal  
CC proteins and RNA polymerase subunits, amongst others. Plasmodium is  
CC detected in a human or animal sample by treating it, or derived  
CC nucleic acid, with a Plasmodium extrachromosomal genetic element or  
CC derived nucleic acid (A) and detecting any hybridisation. (A) can  
CC include the PSL-PL470, PLH-PBH, PRB or PMQ gene, the mitochondrial  
CC coxI gene, and nucleic acids derived from them. Also new are  
CC (A)-specific probes and primers (see V33139-56). The method is  
CC used to diagnose Plasmodium infection. Also (not claimed) the  
CC polypeptides encoded by (A) are useful as targets for drug  
CC development and for development of anti-malaria vaccines. The high  
CC degree of similarity between (A) from different species allows  
CC development of genus- or species-specific assays that result in  
CC fewer false negatives than known methods (typically 1% against 3%).

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

COMMENT On Sep 11, 1998 this sequence version replaced gi:2335056.  
BAC clone C19878K-972D3 is located in band 16p13.11 of chromosome 16. Genes were identified by a combination of five methods: XBRIL (available by anonymous ftp from athur.epm.ornl.gov), GeneFinder (available by anonymous ftp from collin@u.washington.edu), GENSCAN (available using the e-mail server at genscan@genomic.stanford.edu), searches using the EST database at TIGR (http://www.tigr.org/tcd/hcd/hcd.html) and searches against a peptide database. Repeats were identified using RepeatMasker (Smit, A.F.A. and Green, P. unpublished, http://ftp.genome.washington.edu/rm/RepeatMasker.html).

BAC clone F21P24 is from Arabidopsis chromosome II and is contained
in the YAC clone C106C07.
The orientation of the sequence is from SP6 to T7 end of the BAC
clone.
Genes were identified by a combination of three methods: Gene
prediction programs including GRAIL (available by anonymous ftp

```

from arthur.epm.ornl.gov). GeneFinder (Phil Green, University of Washington), GenScan (Chris Burge, <http://genome.stanford.edu/~chris/GENSCANW.html>), and NetPlantGene (<http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html>), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (<http://www.tigr.org/tdb/at.html>). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, <http://genome.wustl.edu/eddy/tRNAscan-SE/>). Simple repeats are identified by RepeatMasker (Arjan Smit, <http://ftp.genome.washington.edu/RM/RepeatMasker.html>). Regions of genomic sequence that are not annotated as genes but have predicted exons by GRAIL are annotated as misc features.

BAC clone T20K9 is from Arabidopsis chromosome II and is contained
in the YAC clone C1C06C07.
The orientation of the sequence is from SP6 to T7 end of the BAC
clone.
Genes were identified by a combination of three methods: Gene
prediction programs including GRAT (available by anonymous ftp
from arthur.epm.ornl.gov), Genefinder (Phil Green, University of
Washington), Genscan (Chris Burge,
http://genome.stanford.edu/~chris/GENSCANW.html), and NetPlantGene
(http://www.cbs.dtu.dk/netgene/cbsnetgene.html), searches of the
complete sequence against a peptide database and the Arabidopsis
EST database at TIGR (http://www.tigr.org/tib/at.html).
Annotated genes are named to indicate the level of evidence for

 On Sep 24, 1998 this sequence version replaced gi:2804161.  
 IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments.  
 \* NOTE: This is a 'working draft' sequence.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.

 Direct Submission  
 Submitted (31-MAR-1999) Drosophila Genome Center, Lawrence Berkeley  
 Laboratory, MS 64-121, Berkeley, CA 94720, USA  
 On Apr 5, 1999 this sequence version replaced gi:4558629.  
 For further information about this sequence, including its location  
 and relationship to other sequences, please visit our sequence  
 archive Web site (<http://www.fruitfly.org/sequence/>) or send email  
 to [bdg@fruitfly.berkeley.edu](mailto:bdg@fruitfly.berkeley.edu). All contigs in this submission meet  
 the following cutoffs: length >= 400 bases, phrap computed error  
 rate <= 1/10.  
 \* NOTE: This is a 'working draft' sequence. It currently  
 \* consists of 20 contigs. The true order of the pieces  
 \* is not known and their order in this sequence record is  
 \* arbitrary. Gaps between the contigs are represented as  
 \* runs of N, but the exact sizes of the gaps are unknown.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.

PT Human colon specific genes and their expression products - detection
PT of which, in non-colon tissue samples, can be used as indication of
PT colon cancer metastasis
PS Claim 1: Fig 5: 60pp: English.
CC 13 cDNA clones (T45880-92), most of them partial clones, correspond
CC to human colon specific genes, designated CSG1, CSG2, etc., that
CC are primarily expressed in tissues derived from the colon. CSG1
CC and CSG10 show reduced expression in colon cancer cells as compared
CC to that in normal cells; the remaining genes are overexpressed in
CC colon cancer. The partial cDNA sequences can be used to isolate
CC full-length clones and genomic clones including the complete gene.
CC CSG nucleic acids can be used to produce CSG polypeptides (see also
CC W06543-53) in transformed host cells, as probes to detect disorders
CC of the colon, partic. colon cancer and colon cancer metastasis, and
CC in gene therapy.

PT Colon-specific nucleic acids - useful as probes for detecting colon
PT cancer metastases
PS Claim 15; Fig 5b-B; 51pp; English.
CC V16668-81 represent polynucleotide sequences of partial or full-length
CC cDNA clones of colon-specific genes. The polynucleotides can be used
CC as probes to detect expression of the corresponding human genes, e.g. in
CC diagnostic assays for detecting micrometastases of colon cancer.
CC Recombinant cells containing the polynucleotides can be used to
CC produce the polypeptides, in order that antibodies can be raised and
CC used in further screening or diagnostics.

DR New isolated Enterococcus faecalis polynucleotides and polypeptides
PT - used to develop products for the detection of Enterococcus and for
PT use in vaccines for prevention or attenuation of Enterococcus
PT infection.
PS Claim 1; Page 907-914; 2084pp; English.
CC A computer readable medium has been developed which has recorded on it
CC 982 nucleotide sequences isolated from the Enterococcus faecalis genome.
CC X12938 to X13919 represent these nucleotide sequences which are primary
CC nucleotide sequences, also known as contigs. The computer-based system
CC can identify fragments of the Enterococcus faecalis genome with
CC commercial importance. The products can be used to detect the presence
CC of Enterococcus faecalis in samples. They can also be used for
CC diagnosing Enterococcal infection in an animal and monitoring
CC progression of disease, and for identifying agents which can be used to
CC modulate the growth or pathogenicity of Enterococcus faecalis, or
CC another related organism, in vivo or in vitro. In particular the
CC polypeptides encoded by the Enterococcus faecalis nucleotide sequences
CC can be used in vaccines to prevent or attenuate an Enterococcal
CC infection.

PT      Polymorphic bovine DNA markers - used in genetic identification,
PT      gene mapping, and selective breeding
PS      Table 7; page 180; 517pp; English.
CC      The sequence is that downstream of a bovine microsatellite sequence
CC      obtd. by screening a library of bovine MboI DNA fragments of between
CC      250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC      One out of 50 clones cross-hybridised. Assuming independent
CC      distribution of microsatellites and MboI sites, the frequency of
CC      (T6)n >9 microsatellites in the bovine genome is estimated at >100.
CC      000. The sequence information for ca. 230 such bovine microsatellites
CC      is summarised in the specification and indexed herein (see below).
CC      The sequences upstream and downstream of the microsatellite sequence
CC      were used to generate the required PCR primers for in vitro
CC      amplification of the corresp. microsatellite (using the program
CC      OPTIPRM). The microsatellites may be used to identify individuals,
CC      for parentage testing, and in the genetic mapping of economic traits,
CC      loci, or genes involved in the determination of economically important
CC      traits esp. in cattle, to allow selective breeding.

DR P-PSDB: R83555.
PT Use of new and known 7B2 proteins - as protease inhibitors, esp. for
PT treating AIDS, hormonal disorders and blood clotting disorders
PS Claim 24; Fig 1; 35pp; Dutch.
CC Protein 7B2, its protease-binding fragments and derivs in which the
CC protease cleavage site is altered are all useful for inhibiting the
CC activity of pro-hormone convertase enzymes (esp. PC2). Release of
CC hormones such as insulin, opiomelanocortin, enkephalins or
CC endorphins from their pro-hormones can be inhibited for treating
CC hormonal disorders. Inhibition of furin-induced release of blood
CC clotting factors from pro-proteins is useful for treating disorders
CC of the blood clotting cascade and inhibition of furin-induced
CC cleavage of gp160 is useful for treating AIDS. Sequences coding for
CC protein 7B2 or its derivs. can be used for gene therapy of the
CC above diseases.

PT Hereditary haemochromatosis gene products - used to develop products
PT for the diagnosis and treatment of hereditary disorders in iron
PT metabolism
PS Claim 1; Fig 9; 209pp; English.
CC The present invention describes hereditary haemochromatosis gene
CC products from the human haemochromatosis gene. The present sequence
CC represents a hereditary haemochromatosis subregion from an hereditary
CC haemochromatosis (HH) affected individual. Also described is a
CC method to determine the presence or absence of the common hereditary
CC haemochromatosis (HFE) gene mutation in an individual comprising:
CC (a) providing DNA or RNA from the individual; and (b) assessing the
CC DNA or RNA for the presence or absence of a haplotype or genotype where
CC the presence or absence of the haplotype genotype indicates the likely
CC presence of the HFE gene mutation in the genome of the individual. The
CC HFE gene sequences from the present invention can be used to develop
CC products for use in the diagnosis and treatment of HFE. The present
CC invention also describes BTF genes, which are homologues of the milk
CC protein butyrophilin (BT), and can be used in the production of agonists
CC and antagonists of BTF function. Also described are: (1) a Rorret gene
CC which can be used to develop products for the study, diagnosis and
CC treatment of lupus and Sjogren's syndrome; and (2) NP13 and NP14 genes
CC which are homologues of a type 1 sodium transport gene, and can
CC similarly be used for hypophosphatemia.

DR Polynucleotide(s) and proteins derived from Staphylococcus aureus

PT stored on computer readable medium and used in the production of

PS anti-S. aureus vaccines

PS Claim 1; Page 1903-1904; 3271pp; English.

CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences

of the invention. The DNA sequences are recorded on a computer readable

medium, preferably selected from a floppy or hard disk, random access

memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using

the S. aureus DNA sequences allows putative functions to be assigned so

that protein-encoding or regulatory regions of commercial, therapeutic or

industrial importance can be obtained. Specifically, sequences which are

likely to encode antigens have been identified and these polypeptides can

be used in a vaccine composition against S. aureus infection. The

polypeptides can also be used in a kit for the immunodetection of

S. aureus in a sample. S. aureus is implicated in numerous human diseases,

including cellulitis, eyelid infections, food poisoning, osteomyelitis,

skin and surgical wound infections, scalded skin syndrome, toxic shock

syndrome, etc. Organisms transformed with the DNA sequences can be used

for recombinant production of the polypeptides. The new DNA sequences

(and their fragments) are useful as primers or probes for isolating

homologues of any of the S. aureus DNA sequences contained on the

computer readable medium.

PT New isolated Enterococcus faecalis polynucleotides and polypeptides

used to develop products for the detection of Enterococcus and for

use in vaccines for prevention or attenuation of Enterococcus

infection.

PS Claim 1; Page 767-783; 2084pp; English.

CC A computer readable medium has been developed which has recorded on it

982 nucleotide sequences isolated from the Enterococcus faecalis genome.

X12938 to X13919 represent these nucleotide sequences which are primary

nucleotide sequences, also known as contigs. The computer-based system

can identify fragments of the Enterococcus faecalis genome with

commercial importance. The products can be used to detect the presence

of Enterococcus faecalis in samples. They can also be used for

diagnosing Enterococcal infection in an animal and monitoring

progression of disease, and for identifying agents which can be used to

modulate the growth or pathogenicity of Enterococcus faecalis, or

another related organism, in vivo or in vitro. In particular the

polypeptides encoded by the Enterococcus faecalis nucleotide sequences

can be used in vaccines to prevent or attenuate an Enterococcal

infection.

DE Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT for diagnosis of abnormal cell function, by preparing cDNA that
PT reflects relative abundance of corresp. mRNA in specific human
PT tissues
PS Claim 1; Page 1138-1139; 2245pp; Japanese.
CC A single-stranded DNA (or its complementary strand or the corresp.
CC double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC given in T19001-T26837 and which is able to hybridise to part of
CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC sequences were obtained from 3'-directed cDNA libraries prepared
CC from various human tissues; synthesis of cDNA was initiated from the
CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC untranslated sequence is unique to a particular mRNA species, almost
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC is constructed so as to reflect accurately the relative abundance of
CC different mRNAs in the particular tissue from which it was derived.

```

CC The appearance frequency of a given GS in a cDNA library can be  
CC determined (esp. using primers and probes derived from the GS  
CC sequences) as a means of diagnosing abnormal cell function or for  
CC recognising different cell types.

PT New polynucleotides encoding human secreted proteins - derived from  
PT e.g. human blood, kidney, foetal lung, placenta, testes, brain,  
PT ovary, pituitary, retina and colon cDNA libraries.

PS Claim 1: Page 192: 618bp; English.  
CC The present sequence represents a human expressed sequence tag (EST).  
CC The polynucleotide, which is a secreted EST, and the encoded protein  
CC are predicted to have useful biological activities which would make  
CC them suitable for treating, preventing or ameliorating medical  
CC conditions in humans and animals, although no supporting data is  
CC given. Suggested activities include nutritional activity, immune  
CC stimulating or suppressing activity, haematopoiesis regulating  
CC activity, tissue growth activity, activin/inhibin activity,  
CC chemotactic/chemokinetic activity, haemostatic and thrombolytic  
CC activity, receptor/ligand activity, anti-inflammatory activity,  
CC cadherin/tumour invasion suppressor activity, tumour inhibition  
CC activity. The polynucleotide may also be useful for gene therapy.

 PT Chimeric human interferon-gamma receptor/immunoglobulin proteins  
 PT - used to inhibit binding of interferon-gamma to its specific  
 PT receptor in the treatment of illnesses  
 PS Disclosure; Figure 1; 29pp; English.  
 CC The soluble form of the interferon (IFN) gamma receptor comprises  
 CC the whole extracellular domain of the natural receptor from the N-  
 CC terminus to the transmembrane region, lacks the cytoplasmic and  
 CC transmembrane domains of the natural receptor and specifically binds  
 CC IFN-gamma. The sequence encoding the soluble IFN-gamma receptor can  
 CC be used in constructs encoding chimeric proteins where the other  
 CC component of the chimeric protein is part or all of the constant  
 CC domain of a human immunoglobulin heavy or light chain. The  
 CC recombinant proteins can be used to inhibit IFN-gamma binding to its  
 CC specific receptor. They can be used for the treatment of  
 CC illnesses, especially autoimmune diseases, chronic inflammation,  
 CC delayed type hypersensitivity, allotransplant rejections, multiple  
 CC sclerosis, fulminant hepatitis, inflammatory neurological diseases  
 CC and neurological complications of AIDS, poliovirus infections, Lyme  
 CC disease and septicemia. The presence of the immunoglobulin  
 CC component in the chimeric protein increases the proteins half life in  
 CC vivo.

 PT Diagnosing and genotyping of hereditary haemochromatosis (HH) -  
 PT using primers to detect specific polymorphisms of the HH gene on  
 PT chromosome 6p2.1 or novel microsatellite markers  
 PS Disclosure: Fig 1y: 67pp: English.  
 CC The sequences given in T43925-55 represent portions of the genome  
 CC surrounding several markers of the invention. The markers were  
 CC identified using the series of primer pairs given in T71901-72  
 CC which were used to determine the presence or absence of the common  
 CC hereditary haemochromatosis (HH) gene mutation in an individual. The  
 CC method comprised assessing genomic DNA from an individual for the  
 CC presence or absence of the HH-associated allele of the single base-pair  
 CC polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional  
 CC marker comprising the following microsatellite repeat alleles of group  
 CC A and optionally of group B:  
 CC Group A: 19D9, 18B4, 1A2, 1E4, 24E2, 28B, 3321-1, 4073-1, 4440-1, 4440-2,  
 CC 731-1, 5091-1, 3216-1, 4072-2, 950-1, 950-2, 950-3, 950-4, 950-5, 950-6,  
 CC 950-8, 63-1, 63-2, 63-3, 65-1, 65-2, 373-8, 373-29, 68-1, 241-6, 241-29;  
 CC Group B: D6S464, D6S306, D6S258, D6S265, D6S109 and D6S1001.  
 CC The absence of the genotype indicates the likelihood of the presence of  
 CC the HH mutation. Knowledge of the new genetic markers allows the  
 CC definition of genotypes characteristic of heterozygous carriers and  
 CC homozygotes having a HH mutation in their genomic DNA. The potential for  
 CC HH in an individual interferes with the effectiveness of interferon  
 CC treatment for hepatitis C infection. By diagnosing this potential, the  
 CC responsiveness of interferon treatment may be evaluated.

 PT Nucleic acid molecule encoding vertebrate pheromone receptor -  
 PT useful to identify modulators for control of reproductive and social  
 PT behaviour, fertility and hormone secretion  
 PS Claim 1; Fig 8; 123pp: English.  
 CC A cDNA clone (T69545) codes for rat pheromone receptor VNI  
 CC (W19103), a member of a novel family of presumed 7-transmembrane  
 CC domain receptors that are evolutionarily independent of the odorant  
 CC receptors of the main olfactory epithelium (MOE). It was isolated  
 CC by differential screening of cDNA libraries constructed from rat  
 CC single vomeronasal sensory neurons. A VNI insert in pBluescript  
 CC has been deposited as ATCC 97294. VNI is expressed only in about  
 CC 4% of VSN and never in the MOE. cDNA clones for VN2-7 were obtd.  
 CC by PCR and hybridisation (see also T69546-50, VN2 sequence not  
 CC given). VN polypeptides (W19103-09) can be expressed in host-  
 CC vector systems for use in identifying modulators for control of  
 CC maternal, reproductive and social behavior, to increase fertility,  
 CC control hormone secretion and to regulate food uptake in humans and  
 CC animals. A human homologue, HG25 (T69551), has also been obtd.

TITLE Direct Submission  
JOURNAL Submitted (10-NOV-1997) Whitehead Institute/MIT Center for Genome  
Research, 320 Charles Street, Cambridge, MA 02141, USA  
COMMENT On Nov 10, 1997 this sequence version replaced gi:2598080.  
The Staden databases, finishing information, and all  
chromatographic files used in the assembly of this clone are  
available from our anonymous ftp site.  
All repeats were identified using RepeatMasker: Smit, A.F.A. &  
Green, P. (1996-1997)  
http://ftp.genome.washington.edu/RM/RepeatMasker.html.

AUTHORS        1 (bases 1 to 135686)
TITLE          WALKINSON, J
JOURNAL        Direct Submission
               Submitted (01-MAY-1997) Sanger Centre, Hinxton, Cambridgeshire,
               CB3 0SA, UK. E-mail enquiries: humquerry@sanger.ac.uk Clone
               requests: clonerequests@sanger.ac.uk
               ON MAY 14, 1997 this sequence version replaced g1:1772969.
COMMENT         IMPORTANT: This sequence is the entire insert of clone 473j6. This
               sequence was generated from part of bacterial clone contigs of
               human chromosome X, constructed by the Sanger Centre chromosome X
               mapping group. Further information can be found at
               http://www.sanger.ac.uk/HGP/chrX/
               This sequence has been finished according to sequence map criteria
               as follows. An attempt is made to resolve all sequencing problems,
               such as compressions and repeats, but not necessarily within known
               annotated human repeat sequence elements (e.g. Alu). Where the
               sequence is ambiguous, there is an annotation using the 'unsure'
               feature key.
               The true left end of clone 473j6 is at 1 in this sequence. The true
               right end of clone 473j6 is at 135686.
               473j6 is from the library RPCR3 constructed at the Roswell Park
               Cancer Institute by the group of Pieter de Jong.
               For further details see http://bacpac.med.buffalo.edu/.

TITLE Direct Submission
JOURNAL Submitted (09-MAY-1999) Wellcome Trust Genome Campus, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries:
humquerry@sanger.ac.uk
Clone requests: clonerequest@sanger.ac.uk
On May 11, 1999 this sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continues. The sequence may be
contaminated with foreign sequence from E.coli, yeast, vector,

```

phage etc. Order of segments is not known; 800 n's separate  
 segments. Unfinished: dJ135L22 Contig\_ID: 00648 acc-AL031767

COMMENT

On May 13, 1999 this sequence version replaced g1:4007196.  
 IMPORTANT: This sequence is unfinished and does not necessarily  
 represent the correct sequence. Work on the sequence is in progress  
 and the release of this data is based on the understanding that the  
 sequence may change as work continues. The sequence may be  
 contaminated with foreign sequence from E.coli, yeast, vector,  
 phage etc. Order of segments is not known; 800 n's separate  
 segments. Unfinished: d3501A4 Contig\_ID: 00902 acc=298051  
 Length: 2580 bp unfinished: d3501A4 Contig\_ID: 01182 acc=298051  
 Length: 26213 bp unfinished: d3501A4 Contig\_ID: 00318 acc=298051  
 Length: 49367 bp.  
 \* NOTE: This is a 'working draft' sequence.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.

source

gene  
 CDS

bin/display7db-wormaccetclass=Sequence object-T12A7  
 Current sequence finishing criteria for the C. elegans genome  
 sequencing consortium are that all bases are either sequenced  
 unambiguously on both strands, or on a single strand with both a  
 dye primer and dye terminator reaction, from distinct subclones.  
 Exceptions are indicated by an explicit note.  
 IMPORTANT: This sequence is NOT necessarily the entire insert of  
 the specified clone. It may be shorter because we only sequence  
 overlapping sections once, or longer because we arrange for a small  
 overlap between neighbouring submissions.  
 This sequence is the entire insert of clone T12A7. The true right  
 end of clone K01A6 is at 1384 in this sequence. The start of this  
 sequence (1..110) overlaps with the end of sequence Z68750.  
 The end of this sequence (39117..39220) overlaps with the start of  
 sequence Z92847.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

/note="Organ: pooled; Vector: pTR73D-Pac (Pharmacia) with  
a modified polylinker; Site.1: Not I; Site.2: Eco RI;  
Equal amounts of plasmid DNA from three normalized  
libraries (fetal lung NBHL19W, testis NHT, and B-cell  
NCI CGAP GCBI) were mixed, and ss circles were made in  
vitro. Following HAP purification, this DNA was used as  
tracer in a subtractive hybridization reaction. The driver  
was PCR-amplified cDNAs from pools of 5,000 clones made  
from the same 3 libraries. The pools consisted of  
I.M.A.G.E. clones 297480-302087, 682632-687239,  
726408-728711, and 729096-731399. Subtraction by Bento  
Soares and M. Fatima Bonaldo.

/note="Organ: liver; Vector: PME18S-FL3; Site\_1: DraIII  
(CAGCTGTG); Site\_2: DraIII (CACCATGTG); 1st strand cDNA  
was primed with an oligo(dT) primer  
[ATGTGGCTTTTCTTTTCTTTT]; double-stranded cDNA was  
ligated to a DraIII adaptor (TGTGGCCCTACTGG), digested  
and cloned into distinct DraIII sites of the PME18S-FL3  
vector (5' site CAGCTGTG, 3' site CACCATGTG). XhoI should  
be used to isolate the cDNA insert. Size selection was  
performed to exclude fragments <1.5kb. Library  
constructed by Dr. Sumio Sugano (University of Tokyo  
Institute of Medical Science). Custom primers for  
sequencing: 5' end primer CTTCGTCTCTMAAGCTGCG and 3' end  
primer CGACCTGACGCTGACGACA."

Submitted (03-DEC-1998) Nematode Sequencing Project, Sanger Centre,  
Hinxton, Cambridgeshire CB10 1HQ, UK and Department of Genetics,  
Washington University, St. Louis, MO 63110, USA. E-mail:  
jessanger.ac.uk or rwenematode.wustl.edu  
On Jul 30, 1998 this sequence version replaced gi:2528903.  
COMMENT Order of segments is not known: 800 n's separate segments.  
IMPORTANT: This sequence is unfinished and does not necessarily  
represent the correct sequence. Work on the sequence is in progress  
and the release of this data is based on the understanding that the  
sequence may change as work continues. The sequence may be  
contaminated with foreign sequence from E. coli, yeast, vector,  
phage etc.  
\* NOTE: This is a 'working draft' sequence.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

2.2 Mb of contiguous nucleotide sequence from chromosome III of C.  
elegans  
Nature 368 (6466), 32-38 (1994)  
http://webc.sanger.ac.uk/cgi-bin/displaydb-wormscsclass-sequence/subject-Y7A9C  
Current sequence finishing criteria for the C. elegans genome  
sequencing consortium are that all bases are either sequenced  
unambiguously on both strands, or on a single strand with both a  
dye primer and dye terminator reaction, from distinct subclones.  
Exceptions are indicated by an explicit note.  
IMPORTANT: This sequence is NOT necessarily the entire insert of  
the specified clone. It may be shorter because we only sequence  
overlapping sections once, or longer because we arrange for a small  
overlap between neighbouring submissions.  
IMPORTANT: This sequence is not the entire insert of clone Y7A9C.  
It may be shorter because we only sequence overlapping sections  
once, or longer because we arrange for a small overlap between  
neighbouring submissions.  
The true left end of clone C11P10 is at 1 in this sequence. The  
true left end of clone K03D3 is at 26718 in this sequence. The true  
right end of clone F38C2 is at 7539 in this sequence. The start of  
this sequence (1..104) overlaps with the end of sequence 282267.  
The end of this sequence (26718..26821) overlaps with the start of  
sequence 282276.

 COMMENT  
 2.2 Mb of contiguous nucleotide sequence from chromosome III of C.  
 elegans  
 Nature 368 (6466), 32-38 (1994)  
 94150718  
 Coding sequences below are predicted from computer analysis, using  
 predictions from GeneFinder (P. Green, U. Washington), and other  
 available information.  
 For a graphical representation of this sequence and its analysis  
 see: "  
 http://webace.sanger.ac.uk/cgi-  
 bin/display?db=wormaceclass=sequence&object=T28F4  
 Current sequence finishing criteria for the C. elegans genome  
 sequencing consortium are that all bases are either sequenced  
 unambiguously on both strands, or on a single strand with both a  
 dye primer and dye terminator reaction, from distinct subclones.  
 Exceptions are indicated by an explicit note.  
 IMPORTANT: This sequence is NOT necessarily the entire insert of  
 the specified clone. It may be shorter because we only sequence  
 overlapping sections once, or longer because we arrange for a small  
 overlap between neighbouring subclones.  
 IMPORTANT: This sequence is not the entire insert of clone T28F4.  
 It may be shorter because we only sequence overlapping sections  
 once, or longer because we arrange for a small overlap between  
 neighbouring subclones.  
 The true left end of clone T28F4 is at 1 in this sequence. The true  
 right end of clone T28F4 is at 10921 in  
 sequence 722503.  
 The true left end of clone C26C6 is at 30464 in this sequence. The  
 true right end of clone ZK524 is at 7785 in this sequence. The  
 start of this sequence (1..104) overlaps with the end of sequence  
 723912.  
 The end of this sequence (30464..30567) overlaps with the start of  
 sequence 722503.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 3
AB017156 2937 bp mRNA ROD 04-MAR-1999
LOCUS AB017156 Mus musculus gob-5 mRNA, complete cds.
DEFINITION AB017156
ACCESSION 93721911
NID 93721911
VERSION AB017156.1 GI:3721911
KEYWORDS GOB-5.
SOURCE Mus musculus adult intestine goblet cell cDNA to mRNA.
ORGANISM Mus musculus
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus.
REFERENCE 1 (sites) Tanigawa,Y. and Hirohashi,S.
AUTHORS Komiya,T., Tanigawa,Y. and Hirohashi,S.
TITLE Cloning and identification of the gene gob-5, which is expressed in
intestinal goblet cells in mice
JOURNAL Biochem. Res. Commun. 255 (2), 347-351 (1999)
MEDLINE 99160866
REFERENCE 2 (bases 1 to 2937)
AUTHORS Komiya,T., Tanigawa,Y. and Hirohashi,S.
TITLE Direct Submission
JOURNAL Submitted (26-AUG-1998) to the DDBJ/EMBL/Genbank databases. Tohtu

PI Human colon specific genes and their expression products - detection

PI of which, in non-colon tissue samples, can be used as indication of

PI colon cancer metastasis

PS claim 1: Fig 5: 60pp: English.

CC 13 cDNA clones (T45880-92), most of them partial clones, correspond

CC to human colon specific genes, designated CS61, CS62, etc., that

CC are primarily expressed in tissues derived from the colon. CS67

CC and CS610 show reduced expression in colon cancer cells as compared

CC to that in normal cells; the remaining genes are overexpressed in

CC colon cancer. The partial cDNA sequences can be used to isolate

CC full-length clones and genomic clones including the complete gene.

CC CS6 nucleic acids can be used to produce CS6 polypeptides (see also

CC W06545-53) in transformed host cells, as probes to detect disorders

CC of the colon, partic. colon cancer and colon cancer metastasis, and

CC in gene therapy.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.  
 PT for diagnosis of abnormal cell function, by preparing cDNA that  
 PT reflects relative abundance of corresp. mRNA in specific human  
 PT tissues  
 PS Claim 1: Page 1138-1139; 2245pp; Japanese.  
 CC A single-stranded DNA (or its complementary strand or the corresp.  
 CC double-stranded DNA) which comprises one of the 7837 "GS" sequences  
 CC given in 119001-176837 and which is able to hybridise to part of  
 CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
 CC sequences were obtained from 3'-directed cDNA libraries prepared  
 CC from various human tissues; synthesis of cDNA was initiated from the  
 CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
 CC untranslated sequence is unique to a particular mRNA species, almost  
 CC all the 3'-oriented cDNAs hybridise with specific mRNA species. Each library  
 CC is constructed so as to reflect accurately the relative abundance of  
 CC different mRNAs in the particular tissue from which it was derived.  
 CC The appearance frequency of a given GS in a cDNA library can be  
 CC determined (esp. using primers and probes derived from the GS  
 CC sequences) as a means of diagnosing abnormal cell function or for  
 CC recognising different cell types.

 PT New isolated prostate-derived nucleic acids - used to develop  
 PT products which may have cytokine, immune regulatory, haematopoiesis  
 PT regulating, anti-inflammatory or tumour inhibition activity  
 PS Claim 1: Page 228; 675pp; English.  
 CC X40438 to X40715 represent 5' expressed sequence tags (ESTs) for human  
 CC secreted proteins expressed in prostate, and encode the proteins given in  
 CC Y1116 to Y1193 respectively. The proteins given represent the signal  
 CC peptide and an N-terminal fragment of a secreted protein. The nucleic

CC acid sequences can be used for producing secreted human gene products.  
 CC They can also be used to develop products for diagnosis and therapy. The  
 CC proteins obtained may have cytokine activity, cell proliferation and  
 CC differentiation activity, haematopoiesis regulating activity, tissue  
 CC growth regulating activity, reproductive hormone regulating activity,  
 CC chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,  
 CC receptor/ligand activity, anti-inflammatory activity, tumour inhibition  
 CC activity or other activities. The products can be used in forensic, gene  
 CC therapy and chromosome mapping procedures. The sequences can also be used  
 CC for obtaining corresponding promoter sequences. The nucleic acids  
 CC encoding the signal peptide can be used for directing extracellular  
 CC secretion of a polypeptide or the insertion of a polypeptide into a  
 CC membrane, or importing a polypeptide into a cell.

PT Helicobacter pylori nucleic acid sequences and related  
PT polypeptide(s) - useful for vaccines to treat or prevent H. pylori  
PT infection, and to detect Helicobacter  
PT Claim 9; Page 887-889; 1481pp; English.  
CC The present sequence encodes a Helicobacter pylori cytoplasmic protein  
CC that may be used in a vaccine to prevent or treat H. pylori  
CC infection or to identify H. pylori polypeptide binding compounds.  
CC useful as potential H. pylori life cycle activators or inhibitors.  
CC The genomic sequence of H. pylori (ATCC 55679) was determined from  
CC overlapping contigs generated by mechanically shearing the bacterial  
CC DNA. The sequences were analysed for ORF of at least 180 nucleotides,  
CC and the predicted coding regions defined by computer evaluation. To  
CC identify likely H. pylori antigens for vaccine development, the amino  
CC acid sequences predicted from various ORF were analysed for significant  
CC homology to other known or exported membrane proteins. Having identified  
CC and determined the sequences of interest, particular regions can be  
CC isolated from H. pylori by PCR amplification for recombinant polypeptide  
CC production, e.g. in E. coli hosts.

CC RAPT1-like protein of Candida albicans. It was isolated from C.  
CC albicans cDNA in lambda ZAP by PCR amplification using primers  
CC (T33887-88) based on conserved regions of RAPT1 and TOR proteins  
CC (see also W04234-35 and W04237-38) and use of the PCR product to  
CC probe C. albicans cDNA libraries. The cDNA can be used for the  
CC prodn. of recombinant RAPT1-like protein, esp. its rapamycin  
CC binding domain, or to design probes/primers used to detect  
CC Candida infection.

 PT New isolated Borrelia burgdorferi nucleic acids - used to develop  
 PT products for the detection, diagnosis, characterisation, prevention  
 PT and therapy of infections, particularly Lyme disease  
 PS Claim 1: Page 157-671; 1128pp; English.  
 CC X20248 to X20402 represent polynucleotide sequences isolated from  
 CC Borrelia burgdorferi (Bb). Products derived from Bb can be used for  
 CC the detection, diagnosis, characterisation, prevention and therapy of  
 CC Bb infections, e.g. Lyme disease. They can also be used for the  
 CC production of biosynthetic products, e.g. enzymes. Borrelia belongs  
 CC to a family of motile, spiral-shaped bacteria called Spirochetes.  
 CC Spirochetes are pathogenic in humans and Borrelia causes epidemic and  
 CC endemic relapsing fever, and Lyme borreliosis, more commonly known as  
 CC Lyme disease.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT	Identifying gene signatures in 3'-directed human cDNA library - e.g
PT	for diagnosis of abnormal cell function, by preparing cDNA that
PT	reflects relative abundance of corresp. mRNA in specific human
PT	tissues
PS	Claim 1: Page 1138-1139; 2245pp; Japanese.
CC	A single-stranded DNA (or its complementary strand or the corresp.
CC	double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC	given in T19001-T16837 and which is able to hybridise to part of
CC	human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC	sequences were obtained from 3'-directed cDNA libraries prepared
CC	from various human tissues; synthesis of cDNA was initiated from the
CC	3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC	untranslated sequence is unique to a particular mRNA species, almost
CC	all the 3'-oriented cDNAs hybridise with specific mRNAs. Each librar
CC	is constructed so as to reflect accurately the relative abundance of
CC	different mRNAs in the particular tissue from which it was derived.
CC	The appearance frequency of a given GS in a cDNA library can be
CC	determined (esp. using primers and probes derived from the GS
CC	sequences) as a means of diagnosing abnormal cell function or for
CC	recognising different cell types.
CC	Sequence 255 BP; 76 A; 52 C; 39 G; 80 T;

 PI colon cancer metastasis  
 PS Claim 1; Fig 5; 60pp; English.  
 CC 13 cDNA clones (745880-92), most of them partial clones, correspond to human colon specific genes, designated CSG1, CSG2, etc., that are primarily expressed in tissues derived from the colon. CSG1 and CSG10 show reduced expression in colon cancer cells as compared to that in normal cells; the remaining genes are overexpressed in colon cancer. The partial cDNA sequences can be used to isolate full-length clones and genomic clones including the complete gene. CSG nucleic acids can be used to produce CSG polypeptides (see also W06545-53) in transformed host cells, as probes to detect disorders of the colon, partic. colon cancer and colon cancer metastasis, and in gene therapy.

 PR New bacteria with increased resistance to stress - have mutation(s)  
 PT in specific genes, particularly lactic acid bacteria with increased  
 PT tolerance of acid, heat or oxidation, useful for fermentation, food  
 PT preservation etc.  
 PS Disclosure: Page 41; 66pp; French.  
 CC The invention relates to the generation of bacteria with better  
 CC resistance to stress, e.g. better resistance to acid conditions,  
 CC temperature and oxidative stress, than the wild type by introducing  
 CC into a gene at least 1 mutation that alters the normal activity of it,  
 CC or of some other gene in the same transcription unit. The gene is  
 CC especially involved in transport of electrons, amino acids, oligopeptides  
 CC or phosphate, in DNA repair, stability of RNA, biosynthesis of guanosine  
 CC phosphates or are new genes. Mutation of the gene is: (a) by  
 CC insertion/deletion of a DNA sequence by recombination (preferably using a  
 CC mobile genetic element, particularly in plasmid pgh:ISS1); (b) treatment  
 CC with mutagen or (c) by spontaneous mutation. The bacteria are  
 CC particularly lactic acid bacteria, specifically Lactococcus,  
 CC Lactobacillus or Streptococcus, and are useful for fermentation (of milk  
 CC or dairy products such as yogurt or cheese), to preserve foods and for  
 CC probiotic purposes. This is an example of a fragment of a mutated arnc  
 CC gene generated by the method of the invention.

PT related nucleic acid - vectors, transformed cells and antibodies, and

PT useful for delivering water-insoluble drugs, and for diagnosis and

PT treatment of para-ganglial abnormalities

PS Claim 3; Fig 1A-1C; 56pp; English.

CC The present sequence represents a cDNA encoding the human diazepam

CC inhibitor/acyl-CoA binding protein (DBI/ACBP) -like protein (DBIH).

CC DBIH cDNA was isolated from a human paranganglia tissue library

CC (PGANOT01). DBIH cDNA can have several uses which may include

CC diagnosis of paranganglia associated disease, in gene therapy or as a

CC probe for mapping the genomic sequence. DBIH protein may be used for

CC diagnosis and treatment of conditions involving abnormal function of

CC the paranganglia (including paranganglioma where it may regulate

CC biosynthesis and metabolism of catecholamines), for generating specific

CC antibodies, as a soluble carrier for normally insoluble drugs or for

CC drug screening.

PT Streptococcus pneumoniae nucleic acid sequences - used in DNA chips

PT for evaluating gene expression, and identification of virulence

PT genes

PS Claim 1; Pages 108-111; 33pp; English.

CC This DNA encodes a S. pneumoniae filamentous temperature sensitive,

CC Arp binding protein and three other proteins of unknown functions.

CC The invention provides DNA sequences (V65201 to V65304) from the

CC Streptococcus pneumoniae genome and corresponding protein sequences

CC (W80605 to W80728). A recombinant host containing a vector comprising any

CC of the above nucleic acids can be used for the recombinant expression of

CC the protein sequences. The invention also provides a DNA chip having

CC arrayed on it at least 15 base pair fragment of any one or more of these

CC DNA sequences. The DNA chip can be used methods for evaluating gene

CC expression in S. pneumoniae and for identifying virulence genes in

CC S. pneumoniae. Antibodies that selectively bind to the above proteins or

CC peptide fragments can be used to treat S. pneumoniae infection. The

CC antibodies can also be used to detect S. pneumoniae cells.

PT	Identifying gene signatures in 3'-directed human cDNA library - e.g.					
PT	for diagnosis of abnormal cell function, by preparing cDNA that					
PT	reflects relative abundance of corresp. mRNA in specific human					
PT	tissues					
PS	Claim 1: Page 1138-1139; 2245pp; Japanese.					
CC	A single-stranded DNA (or its complementary strand or the corresp.					
CC	double-stranded DNA) which comprises one of the 7837 "GS" sequences					
CC	given in 119001-126837 and which is able to hybridise to part of					
CC	human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)					
CC	sequences were obtained from 3'-directed cDNA libraries prepared					
CC	from various human tissues; synthesis of cDNA was initiated from the					
CC	3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-					
CC	untranslated sequence is unique to a particular mRNA species, almost					
CC	all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library					
CC	is constructed so as to reflect accurately the relative abundance of					
CC	different mRNAs in the particular tissue from which it was derived.					
CC	The appearance frequency of a given GS in a cDNA library can be					
CC	determined (esp. using primers and probes derived from the GS					
CC	sequences) as a means of diagnosing abnormal cell function or for					
CC	recognising different cell types.

 PT Human colon specific genes and their expression products - detection of which, in non-colon tissue samples, can be used as indication of colon cancer metastasis  
 PS Claim 1; Fig 5; 60pp; English.  
 CC 13 CDNA clones (745880-92), most of them partial clones, correspond to human colon specific genes, designated CSG1, CSG2, etc., that are primarily expressed in tissues derived from the colon. CSG7 and CSG10 show reduced expression in colon cancer cells as compared to that in normal cells; the remaining genes are overexpressed in colon cancer. The partial CDNA sequences can be used to isolate full-length clones and genomic clones including the complete gene. CSG nucleic acids can be used to produce CS6 polypeptides (see also W06545-53) in transformed host cells, as probes to detect disorders of the colon, partic. colon cancer and colon cancer metastasis, and in gene therapy.

 PT Colon-specific nucleic acids - useful as probes for detecting colon cancer metastases  
 PS Claim 15; Fig 5A-B; 51pp; English.  
 CC VI6668-81 represent polynucleotide sequences of partial or full-length CDNA clones of colon-specific genes. The polynucleotides can be used as probes to detect expression of the corresponding human genes, e.g. in diagnostic assays for detecting micrometastases of colon cancer.  
 CC Recombinant cells containing the polynucleotides can be used to produce the polypeptides, in order that antibodies can be raised and

CC used in further screening or diagnostics.

 PI Barash SC, Dillon PJ, Kunsch CA;  
 P1 WPI: 99-045171/04.  
 DR New isolated Enterococcus faecalis polynucleotides and polypeptides  
 PT used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus infection.  
 PS Claim 1; Page 907-914; 2084pp; English.  
 CC A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal infection.

PT Polymorphic bovine DNA markers - used in genetic identification,

PT gene mapping, and selective breeding

PS Table 7; Page 180; 51pp; English.

CC The sequence is that downstream of a bovine microsatellite sequence

CC obtd. by screening a library of bovine MBOI DNA fragments of between

CC 250 and 500 bp with an (AC)<sub>15</sub> and a (TC)<sub>15</sub> oligonucleotide probe.

CC One out of 50 clones cross-hybridised. Assuming independent

CC distribution of microsatellites and MBOI sites, the frequency of

CC (76)<sub>n</sub> >9 microsatellites in the bovine genome is estimated at >100,

CC 000. The sequence information for ca. 230 such bovine microsatellites

CC is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence

CC were used to generate the required PCR primers for in vitro

CC amplification of the corresp. microsatellite (using the program

CC OPRIPRIM). The microsatellites may be used to identify individuals,

CC for parentage testing, and in the genetic mapping of economic trait

CC loci, or genes involved in the determination of economically important

CC traits esp. in cattle, to allow selective breeding.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 COMMENT

Submitted by:  
 On Dec 30, 1997 this sequence version replaced gi:1703551.

Genome Sequencing Center  
 Department of Genetics, Washington University,  
 St. Louis, MO 63110, USA, and  
 Sanger Centre, Hinxton Hall  
 Cambridge CB10 1HQ, England  
 e-mail: rwenematode.wustl.edu and jesusanger.ac.uk

NOTICE: This sequence may not be the entire insert of this clone.  
 It may be shorter because we only sequence overlapping sections  
 once, or longer because we provide a small overlap between  
 neighboring submissions.

This sequence was finished as follows unless otherwise noted:  
 all regions were double stranded or sequenced with an alternate  
 chemistry; an attempt was made to resolve all sequencing problems,  
 such as compressions and repeats; all regions were covered by  
 sequence from more than one subclone

#### NEIGHBORING COSMID INFORMATION:

The 5' cosmid is F37E3, 500 bp overlap; 3' cosmid is K06A5, 700 bp  
 overlap. Actual start of this cosmid is at base position 497 of  
 CELT23H2; actual end is at 13461 of CELK06A5

#### NOTES:

Coding sequences below are predicted from computer analysis, using  
 the program GeneFinder/P. Green and L. Hillier, ms in preparation).

IMPORTANT: This sequence is unfinished and does not necessarily

represent the correct sequence. Work on the sequence is in progress

and the release of this data is based on the understanding that the

sequence may change as work continues. The sequence may be

contaminated with foreign sequence from E.coli, yeast, vector,

phase etc. Order of segments is not known; 800 n's separate

segments. Unfinished: dj399J4 Contig\_ID: 00813 acc= length: 3481

2.2 Mb of contiguous nucleotide sequence from chromosome III of C.  
elegans  
JOURNAL Nature 368 (6466), 32-38 (1994)  
MEDLINE 94150718  
COMMENT Coding sequences below are predicted from computer analysis, using  
predictions from GeneFinder (P. Green, U. Washington), and other  
available information.  
For a graphical representation of this sequence and its analysis  
see:-  
http://webcace.sanger.ac.uk/cgi-  
bin/displaydb-wormcaceclass-sequence?object=Y37A1B  
Current sequence finishing criteria for the C. elegans genome  
sequencing consortium are that all bases are either sequenced  
unambiguously on both strands, or on a single strand with both a  
dye primer and dye terminator reaction, from distinct subclones.  
Exceptions are indicated by an explicit note.  
IMPORTANT: This sequence is NOT necessarily the entire insert of  
the specified clone. It may be shorter because we only sequence  
overlapping sections once, or longer because we arrange for a small  
overlap between neighbouring subclones.  
IMPORTANT: This sequence is not the entire insert of clone Y37A1B.  
It may be shorter because we only sequence overlapping sections  
once, or longer because we arrange for a small overlap between  
neighbouring subclones.  
The true left end of clone F52B11 is at 98980 in this sequence. The  
true right end of clone C27H2 is at 102 in this sequence. The start  
of this sequence (1..102) overlaps with the end of sequence 282256.  
The end of this sequence (98980..99083) overlaps with the start of  
sequence 282268.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Organ: colon; Vector: pRT30-Pac (Pharmacia) with a  
modified polylinker; Site.1: Not I; Site.2: Eco RI; 1st  
strand cDNA was primed with a Not I - oligo(dT) primer [5'  
TGTTACATCTGAGTGGAGGCGGCGCTTTTCTTTTCTTTT 3'],  
double-stranded cDNA was ligated to Eco RI adaptors  
(Pharmacia), digested with Not I and cloned into the Not I  
and Eco RI sites of the modified pRT30 vector. Library  
went through one round of normalization. Tissue samples  
provided by Dr. Brian Dieckgraefe (Washington University,  
dieck@wustl.edu); colonic mucosa represents a range of  
disease involvement from mild cryptitis to severe  
ulceration, fibrosis, and degeneration. Library  
constructed by Bento Soares and M. Fatima Bonaldo.

PT      Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT      for diagnosis of abnormal cell function, by preparing cDNA that
PT      reflects relative abundance of corresp. mRNA in specific human
PT      tissues
PS      Claim 1: Page 1138-1139; 2245pp; Japanese.
CC      A single-stranded DNA (or its complementary strand or the corresp.
CC      double-stranded DNA) which comprises one of the 7837 "G3" sequences
CC      given in T19001-T26837 and which is able to hybridise to part of
CC      human genomic DNA, cDNA or mRNA is claimed. The G3 (gene signature)
CC      sequences were obtained from 3'-directed cDNA libraries prepared
CC      from various human tissues; synthesis of cDNA was initiated from the
CC      3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC      untranslated sequence is unique to a particular mRNA species, almost
CC      all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC      is constructed so as to reflect accurately the relative abundance of

```

```

CC different mRNAs in the particular tissue from which it was derived.
CC The appearance frequency of a given GS in a cDNA library can be
CC determined (esp. using primers and probes derived from the GS
CC sequences) as a means of diagnosing abnormal cell function or for
CC recognising different cell types.

PT New isolated large tumour suppressor gene - used to develop prods.
PT for inhibiting cell proliferation or for enhancing proliferation
PS Claim 6; Page 118-123; 215pp; English.
CC This sequence encodes a human large tumour suppressor h-lats protein,
CC cDNA library using a 2.1-kb DNA probe from the mouse m-lats gene
CC (T42119). The full-length cDNA is present in plasmid pBS(KS)-h-lats.
CC The gene encodes a putative protein-serine/threonine-kinase, and
CC inhibits cell proliferation and plays a crucial role throughout
CC development. Activators or inhibitors of lats function (e.g. an
CC antisense oligonucleotide or dominant-negative lats fragment) may be
CC used in therapy of cancer or other proliferative disorders,
CC degenerative disorders, trauma, growth deficiency, etc., and
CC fragments of the gene may be used as diagnostic probes. A
CC lats-inhibitor sequence may be expressed in a transgenic plant or
CC farm animal to confer increased growth and inhibit senescence.

 DR Detection of protein code region on DNA base sequence - using method  
 PT which reduces interference from noncoding region  
 PS Disclosure; Fig 2-5; 16pp; Japanese.  
 CC The present sequence encodes the human heterogeneous nuclear  
 CC ribonucleoprotein (hnRNP) core protein A1, which is used to exemplify  
 CC the method of the present invention. The hnRNP A1 gene can be found on  
 CC the genbank database accession number X12671, NID 932344. The present

CC invention describes a method for the detection of a protein coding  
 CC region in a DNA base sequence by judging the probability where a  
 CC specific sequence will be found. The method comprises utilizing the  
 CC appearance frequency in the coding and the noncoding regions. The  
 CC method allows noise in the noncoding region to be reduced.

 CC This is the complete nucleotide (nt) sequence of adenovirus 17  
 CC (Ad17). A claimed chimeric adenoviral vector comprises a nt  
 CC sequence of an adenovirus in which all or part of a gene encoding  
 CC a protein facilitating attachment to, or internalisation into, a  
 CC target mammalian cell is replaced by all or part of the  
 CC corresponding gene for a second adenovirus from subgroup D,  
 CC preferably selected from Ad9, Ad15, Ad17, Ad19, Ad20, Ad22, Ad26,  
 CC Ad27, Ad28, Ad30 and Ad39. The vector further comprises a  
 CC transgene operably linked to a eukaryotic promoter to allow  
 CC expression in a mammalian cell. The replaced gene preferably  
 CC encodes an Ad fibre such as Ad17 penton base (see V27113) and/or an Ad  
 CC penton base such as Ad17 penton base (see V27114). The chimeric  
 CC vector is used to target biologically active proteins to airway  
 CC epithelial cells, especially for gene therapy of diseases such as  
 CC cystic fibrosis or alpha-antitrypsin deficiency. The vectors are  
 CC based on the discovery that proteins from the subgroup D viruses,  
 CC a group not normally associated with human respiratory diseases,  
 CC can effectively bind and internalise within human airway  
 CC epithelial cells.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

      elegans
      Nature 368 (6466), 32-38 (1994)
      94150718
      JOURNAL      Nature
      MEDLINE      94150718
      COMMENT      On Jul 19, 1997 this sequence version replaced gi:1877066.
      Coding sequences below are predicted from computer analysis, using
      predictions from GeneFinder (P. Green, U. Washington), and other
      available information.
      For a graphical representation of this sequence and its analysis
      see:
      http://webc.sanger.ac.uk/cgi-
      bin/display?db=wormbase&class=Sequence&object=C29F7
      Current sequence finishing criteria for the C. elegans genome
      sequencing consortium are that all bases are either sequenced
      unambiguously on both strands, or on a single strand with both a
      dye primer and dye terminator reaction, from distinct subclones.
      IMPORTANT: This sequence is NOT necessarily the entire insert of
      the specified clone. It may be shorter because we only sequence
      overlapping sections once, or longer because we arrange for a small
      overlap between neighbouring submissions.
      IMPORTANT: This sequence is not the entire insert of clone C29F7.
      It may be shorter because we only sequence overlapping sections

```

AUTHORS Pearce, A.
TITLE Direct Submission
JOURNAL Submitted (15-DEC-1997) sanger.ac.uk/HGP/ChrX/ Sanger Centre,
Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries:
humquerry@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Dec 18, 1997 this sequence version replaced gi:2598443.
IMPORTANT: This sequence is not the entire insert of clone 262B17.
It may be shorter because we only sequence overlapping sections
once, or longer because we arrange for a small overlap between
neighbouring submissions.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variations annotated may not be found in the sequence submission
corresponding to the overlapping clone as we submit sequences with
only a small overlap as described above.
This sequence was generated from part of bacterial clone contigs of
human chromosome X, constructed by the Sanger Centre chromosome X
mapping group. Further information can be found at
http://www.sanger.ac.uk/HGP/ChrX/
This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
sequence is ambiguous, there is an annotation using the 'unsure'
feature key.
The true left end of clone 262B17 is at 1 in this sequence. The
true left end of clone 27K14 is at 66633.
262B17 is from the library RPII constructed at the Roswell Park
Cancer Institute by the group of Pieter de Jong.
For further details see http://bacpac.med.buffalo.edu/.

JOURNAL  
Direct Submission  
Submitted (12-MAY-1999) Sanger Centre, Hinxton, Cambridgeshire,  
CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk  
COMMENT  
On Dec 8, 1998 this sequence version replaced gi:2689203.  
requests: clone@sanger.ac.uk  
During sequence assembly data is compared from overlapping clones.  
Where differences are found these are annotated as variations  
together with a note of the overlapping clone name. Note that the  
variation annotation may not be found in the sequence submission  
corresponding to the overlapping clone, as we submit sequences with  
only a small overlap as described above.  
The following abbreviations are used to associate primary accession  
numbers given in the feature table with their source databases:  
Em: EMBL; Sw: SWISSPROT; Tr: TrEMBL.  
This sequence is the entire insert of clone 201D17. This sequence  
has been finished according to sequence map criteria as follows. An  
attempt is made to resolve all sequencing problems, such as  
compressions and repeats, but not necessarily within known  
annotated human repeat sequence elements (e.g. Alu). Where the  
sequence is ambiguous, there is an annotation using the 'unsure'  
feature key.  
This sequence was generated from part of bacterial clone contigs of  
human chromosome X, constructed by the Sanger Centre Chromosome X  
Mapping Group. Further information can be found at  
http://www.sanger.ac.uk/HGP/Chrx  
201D17 is from the library RPII constructed at the Roswell Park  
Cancer Institute by the group of Pieter de Jong. For further  
details see http://bacpac.med.buffalo.edu/VECTOR: PCIPAC2.

AUTHORS Direct Submission
TITLE Submitted (11-JUN-1999) Wellcome Trust Genome Campus, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries:
humquery@sanger.ac.uk Clone requests: clonerequests@sanger.ac.uk
On Jun 12, 1999 this sequence version replaced gi:5050941.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continues. The sequence may be
contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate
segments. Unfinished: d164F3 Contig_ID: 03649 acc=AL035422
length: 216991 bp.
* NOTE: This is a 'working draft' sequence.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

PT Colon-specific nucleic acids - useful as probes for detecting colon  
cancer micrometastases  
PS Claim 15: Fig 5A-B; 51pp; English.  
CC V16668-81 represent polynucleotide sequences of partial or full-length  
cDNA clones of colon-specific genes. The polynucleotides can be used  
as probes to detect expression of the corresponding human genes, e.g. in  
diagnostic assays containing the polynucleotides of colon cancer.  
CC Recombinant cells containing the polynucleotides can be used to  
produce the polypeptides, in order that antibodies can be raised and  
used in further screening or diagnostics.

PT New isolated human genes and the secreted polypeptides they encode  
PT - useful for diagnosis and treatment of e.g. cancers, neurological  
PT disorders, immune diseases, inflammation or blood disorders  
PS Claim 1a: Page 193-194, 280pp; English.  
CC This invention describes novel isolated human secreted proteins and  
CC their encoding nucleic acid sequences. The products of the invention  
CC are useful for preventing, treating or ameliorating medical conditions  
CC e.g. by protein or gene therapy. Also pathological conditions can be  
CC diagnosed by determining the presence or amount of expression of  
CC the new polypeptides in a sample or by determining the presence or  
CC absence of mutations in the new polynucleotides. Specific uses are  
CC described for each of the 70 polynucleotides, based on which tissues they  
CC are most highly expressed in, and include developing products for the  
CC diagnosis or treatment of cancer, tumours, neurodegenerative  
CC disorders, developmental abnormalities and foetal deficiencies, blood  
CC disorders, leukemias, diseases of the immune system, autoimmune diseases,  
CC hepatic and renal disease, lymphomas, inflammation, allergic asthma,  
CC sepsis, diabetes, Alzheimer's and cognitive disorders, schizophrenia,  
CC osteoporosis, arthritis, psoriasis, digestive/endocrine disorders,  
CC infections and AIDS. The human secreted proteins of the invention are  
CC represented in Y07744-Y07850 and the encoding nucleic acids are  
CC represented in X37369-X37441.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE         Grafham/D.
JOURNAL       Submitted (14-OCT-1997) Chromosome 1 Project Group
              (http://www.sanger.ac.uk/HGP/Chr1/) Sanger Centre, Hinxton,
              Cambridgeshire, CB10 1SA, UK. E-mail enquiries:
              cambridge@sanger.ac.uk
              On Oct 31, 1997 this sequence version replaced gi:2225976.
              IMPORTANT: This sequence is not the entire insert of clone 106H8.
              It may be shorter because we only sequence overlapping sections
              once, or longer because we arrange for a small overlap between
              neighbouring submissions.
              During sequence assembly data is compared from overlapping clones.
              Where differences are found these are annotated as variations
              together with a note of the overlapping clone name. Note that the
              variations annotated may not be found in the sequence submission
              corresponding to the overlapping clone as we submit sequences with
              only a small overlap as described above.
              This sequence was generated from part of bacterial clone contigs of
              human chromosome 1, constructed by the Sanger Centre chromosome 1
              mapping group. Further information can be found at
              http://www.sanger.ac.uk/HGP/Chr1/
              This sequence has been finished according to sequence map criteria
              as follows. An attempt is made to resolve all sequencing problems,
              such as compressions and repeats, but not necessarily within known
              annotated human repeat sequence elements (e.g. Alu). Where the
              sequence is ambiguous, there is an annotation using the 'unsure'
              feature key.
              The true right end of clone 125H23 is at 104 in this sequence. The
              true right end of clone 106H8 is at 175825.
              106H8 is from the library RPC11 constructed at the Roswell Park
              Cancer Institute by the group of Pieter de Jong.
              For further details see http://bacpac.med.buffalo.edu/.

 TITLE Direct Submission  
 JOURNAL Submitted (16-MAR-1999) Drosophila Genome Center, Lawrence Berkeley  
 Laboratory, MS 64-121, Berkeley, CA 94720, USA  
 COMMENT On Jun 1, 1999 this sequence version replaced g1:4803907.  
 For further information about this sequence, including its location  
 and relationship to other sequences, please visit our sequence  
 archive web site (<http://www.fruitfly.org/sequence/>) or send email  
 to [help@fruitfly.org](mailto:help@fruitfly.org). All contigs in this submission meet  
 the following cutoffs: length >= 400 bases, phrap computed error  
 rate <= 1/10.  
 \* NOTE: This is a 'working draft' sequence. It currently  
 \* consists of 3 contigs. The true order of the pieces  
 \* is not known and their order in this sequence record is  
 \* arbitrary. Gaps between the contigs are represented as  
 \* runs of N, but the exact sizes of the gaps are unknown.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.  
 \* 1 733: contig of 733 bp in length  
 \* 734 813: gap of unknown length  
 \* 814 41210: contig of 40397 bp in length  
 \* 41211 41290: gap of unknown length  
 \* 41291 169526: contig of 128236 bp in length.

Fax: (319) 356-3347  
Email: jeff-murray@uiowa.edu

Primer A: TGACTAGAGGAAAAAGCTTGG  
Primer B: TTAGTCTGACACGGGAAAG  
STS size: 122

## PCR Profile:

denature: 30 seconds at 94 degrees C  
annealing: 75 seconds at 55 degrees C  
extension: 15 seconds at 72 degrees C  
PCR cycles: 27  
extension: 6 minutes at 72 degrees C

## Protocol:

Template: 30ng genomic DNA  
Primer: each 1.5 pmole  
dNTPs: each 200 uM  
Tag Polymerase: 0.3 units  
Total Vol: 10 uL

## Buffer:

MgCl2: 1.5mM  
KCl: 50mM  
Tris: 10mM  
pH: 8.3

2 (bases 1 to 190000)

Stone, N.E., Schmutz, J.J., Cox, D.R. and Myers, R.M.

Direct Submission

Submitted (21-JAN-1999) Department of Genetics, Stanford Human

Genome Center, 855 California Avenue, Palo Alto, CA 94304, USA

On Jun 8, 1999 this sequence version replaced gi:4966377.

\* NOTE: This is a 'working draft' sequence. It currently

\* consists of 12 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

1 1122: contig of 1122 bp in length

* NOTE: This is a 'working draft' sequence. It currently
* consists of 1 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved

## SOURCE INFORMATION:

This clone was derived from human PAC library RPCI-5, prepared by Pieter de Jong and coworkers at Roswell Park Cancer Institute, using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from one male donor. For further details, see <http://bacpac.med.buffalo.edu/>. The clone is available from Genome Systems, Inc. (<http://www.genomesystems.com>).

## VECTOR: pCYPAC2

## NEIGHBORING SEQUENCE INFORMATION:

The clone sequenced to the left is D10981816: the clone sequenced to the right is D1159C10. Actual start of this clone is at base position 1 of D10870F17; actual end is at 155382 of D10870F17.

NOTICE: This sequence may not represent the entire insert of this
clone. It may be shorter because we only sequence overlapping
clone sections once, or longer because we provide a small overlap
between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:
all regions were double stranded or sequenced with an alternate
chemistry; an attempt was made to resolve all sequencing problems,
such as compressions and repeats; all regions were covered by
sequence from more than one subclone; and the assembly was
confirmed by restriction digest.

MAPPING INFORMATION:
The sequence of this clone was established as part of a mapping and
sequencing collaboration between the NHGRI Chromosome 7 Mapping
Project (Eric D. Green, Director), John D. McPherson in the
Department of Genetics (Washington University), and the Washington
University Genome Sequencing Center. For additional information
about the map position of this sequence, see
http://www.nhgri.nih.gov/DIR/CTB/CHR7, send

COMMENT MO 63108, USA  
On Apr 7, 1999 this sequence version replaced gi:4508163.  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 2 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.  
FEATURES  
source 1 49134: contig of 49134 bp in length  
\* 49135 49152: gap of unknown length  
\* 49153 142178: contig of 93026 bp in length.

Direct Submission  
Submitted (12-APR-1999) Whitehead Institute/MIT Center for Genome  
Research, 320 Charles Street, Cambridge, MA 02141, USA  
On Apr 12, 1999 this sequence version replaced g1:4580489.  
All repeats were identified using RepeatMasker: Smt, A.F.A. &  
Green, P. (1996-1997)  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>

Only 126732 base pairs from the middle of this clone are being  
submitted. The remainder overlaps either accession number AC003950  
(WICGR project 1261) or accession number AC004584 (WICGR project  
L312).

Pred. NO. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

 PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -  
 PT stored on computer readable medium and used in the production of  
 PT anti-S.aureus vaccines  
 PS Claim 1; Page 1794; 3271pp; English.  
 CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences  
 CC of the invention. The DNA sequences are recorded on a computer readable  
 CC medium, preferably selected from a floppy or hard disk, random access  
 CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using  
 CC the S.aureus DNA sequences allows putative functions to be assigned so  
 CC that protein-encoding or regulatory regions of commercial, therapeutic or  
 CC industrial importance can be obtained. Specifically, sequences which are  
 CC likely to encode antigens have been identified and these polypeptides can  
 CC be used in a vaccine composition against S.aureus infection. The  
 CC polypeptides can also be used in a kit for the immunodetection of  
 CC S.aureus in a sample. S.aureus is implicated in numerous human diseases,  
 CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,  
 CC skin and surgical wound infections, scalded skin syndrome, toxic shock  
 CC syndrome, etc. Organisms transformed with the DNA sequences can be used  
 CC for recombinant production of the polypeptides. The new DNA sequences  
 CC (and their fragments) are useful as primers or probes for isolating  
 CC homologues of any of the S.aureus DNA sequences contained on the  
 CC computer readable medium.

 PT Computer-readable medium with recorded Streptococcus pneumoniae  
 PT polynucleotide sequences - useful in diagnostic kits and assays, and  
 PT pharmaceutical compositions and vaccines for Streptococcus  
 PT pneumoniae  
 PS Claim 1: Page 1078-1080; 1409pp; English.  
 CC The present invention describes a computer readable medium which has  
 CC the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded  
 CC on it, or a representative fragment or a sequence at least 95% identical  
 CC to SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1  
 CC to 391 (V52134 to V52524) are genomic fragments from Streptococcus  
 CC pneumoniae. The present invention also describes an isolated nucleic acid  
 CC molecule encoding a homologue of any of the fragments of the S.pneumoniae  
 CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced  
 CC by a process comprising: (a) screening a genomic DNA library using as a  
 CC probe a target sequence defined by any of the sequences in SEQ ID NO:1  
 CC to 391, identifying members of the library which contain sequences  
 CC that hybridize to the target sequence and isolating the nucleic acid  
 CC molecules from the members; or (b) isolating mRNA, DNA or cDNA produced  
 CC from an organism, amplifying nucleic acid molecules whose nucleotide  
 CC sequence is homologous to amplification primers derived from the  
 CC fragment of the S. pneumoniae genome to prime the amplification and  
 CC isolating the amplified sequences. The computer readable medium can be  
 CC used in a computer-based system for identifying fragments of the  
 CC S. pneumoniae genome of commercial importance, or expression modulating  
 CC fragments of the S. pneumoniae genome. Products from the present  
 CC invention can be used in diagnosis kits and assays, and pharmaceutical  
 CC compositions and vaccines for S. pneumoniae.

 PT Novel Streptococcus pneumoniae proteins and related DNA -- useful for  
 PT diagnosing anti-microbial agents for treatment of bacterial  
 PT infections  
 PS Claim 4: Page 244; 483pp; English.  
 CC This sequence encodes a Streptococcus pneumoniae protein that (based on  
 CC homology with an Escherichia coli protein) is a PFS protein, and  
 CC represents a DNA sequence of the invention. The DNA sequences were  
 CC isolated from Streptococcus pneumoniae strain 0100993 (NCIMB 40794). The  
 CC Streptococcus pneumoniae proteins of the invention can be used to  
 CC identify compounds which interact with and inhibit or activate the  
 CC activity of the proteins. Antagonists can be used to treat diseases  
 CC caused by S. pneumoniae proteins, through genetic immunisation. They can  
 CC also be used to induce an immunological response in a mammal by  
 CC inoculation with the S. pneumoniae proteins or delivery of the encoding  
 CC nucleic acids in a vector adequate to produce antibody and/or T cell  
 CC immune responses to protect the animal from disease. The proteins can  
 CC also be used to identify antimicrobial compounds which are capable of  
 CC inhibiting their bioactivity. In particular the proteins of the invention  
 CC can be used to prevent adhesion of bacteria to mammalian extracellular  
 CC matrix proteins on in-dwelling devices or in wounds, to block progression of  
 CC mediated mammalian cell invasion, and to block the normal progression of  
 CC pathogenesis in infections initiated other than by the implantation of  
 CC in-dwelling devices or other surgical techniques.

PT ovary, pituitary, retina and colon cDNA libraries

PS Claim 1; Page 388; 633pp; English.

CC This sequence represents an expressed sequence tag (EST), and is a

CC polynucleotide of the invention. The polynucleotides of the invention are

CC all secreted EST sequences isolated from a variety of human tissue

CC sources. The EST sequences and proteins encoded by them are predicted to

CC have useful biological activities which would make them suitable for

CC treating, preventing or ameliorating medical conditions in humans and

CC animals, although no supporting data is given. Suggested activities

CC include nutritional activity, immune stimulating or suppressing activity,

CC haematopoiesis regulating activity, tissue growth activity,

CC activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic

CC and thrombolytic activity, receptor/ligand activity, anti-inflammatory

CC activity, cadherin/tumour invasion suppressor activity, tumour inhibition

CC activity. The EST sequences are also stated to be useful for gene

PT	Complete genome sequence of methano-genic archaeon. Methanococcus				
PT	jannaschii - useful in identification of M. jannaschii genome				
PT	fragment				
PS	Claim 13; Page 152-585; 614pp; English.				
CC	The present sequence represents the complete 1.66-megabase pair genome				
CC	sequence of the Methanococcus jannaschii open reading frames from the				
CC	present invention describes M. jannaschii open reading frames from the				
CC	genome sequence. The invention also describes a computer based system				
CC	for identifying fragments of the M. jannaschii genome that are				
CC	homologous to target nucleotide sequences, comprising: (a) data storage				
CC	means comprising the nucleotide sequence of the 1664976, 58407 or 16550				
CC	bp sequence (see V21209, V21210 and V21211), or a nucleotide sequence at				
CC	least 99.9% identical to it; (b) search means for comparing a target				
CC	sequence to the nucleotide sequence of the data storage means to				
CC	identify a homologous sequence, and (c) retrieval means for obtaining				
CC	the homologous sequence. The method, which is based on whole genome				
CC	random sequencing of an autotrophic archaeon M. jannaschii, the genome				
CC	of which consists of 3 physically distinct elements, a large circular				
CC	chromosome (the 1664976 bp sequence given in V21209), a large circular				
CC	extra-chromosomal element (the 58407 bp sequence given in V21210), and a				
CC	small circular extra-chromosomal element (the 16550 bp sequence given in				
CC	V21211), can be used in the identification of M. jannaschii genome				
CC	fragment.

FT Novel polypeptide(s) from *Staphylococcus aureus* strain WCH29 - used  
PT to isolate antimicrobial compounds, and in vaccines against *S.*  
PT *aureus* infection  
PS Claim 9; Pages 683-684; 989pp; English.  
CC The present sequence encodes a *Staphylococcus aureus* protein of  
CC unknown function. The present sequence was isolated from a  
CC library of clones of *S. aureus* WCH 29 in *Escherichia coli*. The DNA  
CC sequence can be used in the construction of ribozymes and antisense  
CC sequences to control the expression of *Staphylococcus* genes. The DNA  
CC sequence is also useful as a source of regulatory elements for the  
CC control of bacterial gene expression. The encoded protein may be used  
CC to produce vaccines to enable a host to produce specific antibodies  
CC with antibacterial action. These vaccines and antibodies would protect  
CC a host against invasion by *S. aureus*, and conditions relating to  
CC *Staphylococcus* infection, e.g. *Staphylococcal* food poisoning, scalded  
CC skin syndrome, and toxic shock syndrome.

PT New ras carboxyl terminal processing protein useful for identifying  
PT modulators useful in therapy.  
PS Claim 2; Fig 1; 52pp; English.  
CC This cDNA sequence encodes a novel human protein (see W98105)  
CC that functions as a ras carboxyl terminal processing protein, and  
CC optionally as a ras processing enzyme (i.e. ras protease). The  
CC cDNA was cloned from a human colorectal adenocarcinoma cDNA  
CC library following a homology search using yeast RCEL, the protease  
CC responsible for ras processing in yeast. The cDNA has been  
CC expressed in recombinant host cells which produce active  
CC recombinant protein. The recombinant protein, and recombinant  
CC host cells are utilised in a method for identifying modulators  
CC of the enzyme activity, useful for treating a condition mediated  
CC by activated ras protein. Inhibition of the human ras protease  
CC should be efficacious for cancer treatment. Recombinant DNA  
CC molecules, and portions of them, are useful for isolating  
CC homologous sequences, identifying and isolating genomic  
CC equivalents, and identifying, detecting or isolating mutant  
CC forms of the ras carboxyl terminal processing protein DNA.

PT Helicobacter pylori nucleic acid sequences and related  
PT polypeptide(s) - useful for vaccines to treat or prevent H. pylori  
PT infection, and to detect Helicobacter  
PS Claim 27; Page 311, 1481pp; English.  
CC This sequence encodes a H. pylori protein likely to contain two  
CC membrane spanning regions.  
CC The protein may be used in a vaccine to prevent or treat H. pylori  
CC infection or to identify H. pylori polypeptide binding compounds,  
CC useful as potential H. pylori life cycle activators or inhibitors.  
CC The genomic sequence of H. pylori (ATCC 55679) was determined from  
CC overlapping contigs generated by mechanically shearing the bacterial  
CC DNA. The sequences were analysed for ORF of at least 180 nucleotides,  
CC and the predicted coding regions defined by computer evaluation. To  
CC identify likely H. pylori antigens for vaccine development, the amino  
CC acid sequences predicted from various ORF were analysed for significant  
CC homology to other known or exported membrane proteins. Having identified  
CC and determined the sequences of interest, particular regions can be  
CC isolated from H. pylori by PCR amplification for recombinant polypeptide  
CC production, e.g. in E. coli hosts.

PT Helicobacter pylori nucleic acid sequences and related  
PT polypeptide(s) - useful for vaccines to treat or prevent H. pylori  
PT infection, and to detect Helicobacter  
PS Claim 27; Page 856; 1481pp; English.  
CC This sequence encodes a H. pylori protein likely to contain two  
CC membrane spanning regions.  
CC The protein may be used in a vaccine to prevent or treat H. pylori  
CC infection or to identify H. pylori polypeptide binding compounds,  
CC useful as potential H. pylori life cycle activators or inhibitors.  
CC The genomic sequence of H. pylori (ATCC 55679) was determined from  
CC overlapping contigs generated by mechanically shearing the bacterial  
CC DNA. The sequences were analysed for ORF of at least 180 nucleotides,  
CC and the predicted coding regions defined by computer evaluation. To  
CC identify likely H. pylori antigens for vaccine development, the amino  
CC acid sequences predicted from various ORF were analysed for significant  
CC homology to other known or exported membrane proteins. Having identified  
CC and determined the sequences of interest, particular regions can be  
CC isolated from H. pylori by PCR amplification for recombinant polypeptide  
CC production, e.g. in E. coli hosts.

PT of proliferative disease.  
PS Claim 5: Page 50-55: 73pp: English.  
CC A cDNA sequence (T08711) encodes sak-a (R92177), a novel

CC serine/threonine kinase associated with mitotic and meiotic cell  
CC division. It was isolated from a murine lymphoid cell (J333n25)  
CC cDNA library established in CHO cells by selection of wheatgerm  
CC agglutinin-resistant clones. Another cDNA clone (T08712) encoded  
CC the sak-b isoform (R92214). Sak-a and sak-b are probably  
CC alternatively spliced forms of the gene. The sak gene can be used  
CC for prodn. of recombinant SAK, as a probe in the diagnosis of  
CC proliferative disorders or, in antisense form, may be used to treat  
CC such disorders.

PT      Polynucleotide(s) and proteins derived from Staphylococcus aureus -
PT      stored on computer readable medium and used in the production of
PT      anti-S.aureus vaccines
PS      Claim 1: Page 1374-1375: 3271pp; English.
CC      This sequence represents one of 5191 Staphylococcus aureus DNA sequences
CC      of the invention. The DNA sequences are recorded on a computer readable
CC      medium, preferably selected from a floppy or hard disk, random access
CC      memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
CC      the S.aureus DNA sequences allows putative functions to be assigned so
CC      that protein-encoding or regulatory regions of commercial, therapeutic or
CC      industrial importance can be obtained. Specifically, sequences which are
CC      likely to encode antigens have been identified and these polypeptides can
CC      be used in a vaccine composition against S.aureus infection. The
CC      polypeptides can also be used in a kit for the immunodetection of
CC      S.aureus in a sample. S.aureus is implicated in numerous human diseases,
CC      including cellulitis, eyelid infections, food poisoning, osteomyelitis,
CC      skin and surgical wound infections, scalded skin syndrome, toxic shock
CC      syndrome, etc. Organisms transformed with the DNA sequences can be used
CC      for recombinant production of the polypeptides. The new DNA sequences
CC      (and their fragments) are useful as primers or probes for isolating
CC      homologues of any of the S.aureus DNA sequences contained on the
CC      computer readable medium.

DR DNA constructs which modify expression of senescence-related genes -
PT useful to accelerate or inhibit senescence in crop plants
PS Claim 14: Page 54; 78pp; English.
CC The sequences given in T35095-133 are senescence related genes and
CC fragments which were used in the construct of the invention which
CC modifies the expression of at least one senescence related gene.
CC Using these constructs senescence may be inhibited or accelerated
CC in plants including tomato, lettuce, cabbage, banana, strawberry,
CC wheat, maize, rice, rape or soybean. Delayed senescence may
CC indirectly prolong the life of the plant, increase yield, increase
CC protein content of fruits, improve quality of leafy vegetables,
CC improve tolerance to disease, drought or other stress. Increased
CC senescence may more rapidly break down unwanted plant material and
CC so avoid the use of desiccants on crops. This sequence represents the
CC senescence down-regulating clone, PSEND35, which is also known as 7256.
CC PSEND35 is a cDNA of approx. 0.7 kb. The mRNA encoded by PSEND35 is
CC expressed in green leaves of tomato plants, but at the onset of
CC senescence its expression is switched off. PSEND35 encodes a
CC protein of unknown function. PSEND35 is deposited as NCIMB 40580.

 JOURNAL Submitted (11-SEP-1998) The Institute for Genomic Research, 9712 Medical Center Dr., Rockville, MD 20850, USA  
 COMMENT On Sep 11, 1998 this sequence version replaced gi:2335056. BAC clone C1987SK-972D3 is located in band 16p13.11 of chromosome 16. Genes were identified by a combination of five methods: XGRL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (available by anonymous ftp from colin@u.washington.edu), GENSCAN (available using the e-mail server at genscan@genomic.stanford.edu), searches of the EST database at TIGR (http://www.tigr.org/tcd/hcd/hcd.html) and searches against a peptide database. Repeats were identified using RepeatMasker (sm1t, A.F.A. and Green, P. unpublished, http://ftp.genome.washington.edu/rm/RepeatMasker.html).

COMMENT Submitted (27-MAR-1998) Department of Genetics, Stanford Human  
Genome Center, 885 California Avenue, Palo Alto, CA 94304, USA  
On Mar 2, 1999 this sequence version replaced gi:4225908.  
\* NOTE: This is a "working draft" sequence. It currently  
\* consists of 50 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.  
\* 1  
\* 1049 1048: contig of 1048 bp in length  
\* 1177 1176: gap of unknown length  
\* 2584 2583: contig of 1407 bp in length  
\* 2712 2711: gap of unknown length  
\* 4171 4170: contig of 1459 bp in length  
\* 4299 4298: gap of unknown length  
\* 5775 5774: contig of 1476 bp in length

COMMENT

Svirskas, R.R., Wan, K.H., Weinburg, T., Zhang, R., Zieran, L.L. and Rubin, G.M.  
 Direct Submission  
 Submitted (20-May-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA  
 On May 24, 1999 this sequence version replaced gi:4883580.  
 For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive web site (<http://www.fruitfly.org/sequence/>) or send email to [bdg@fruitfly.berkeley.edu](mailto:bdg@fruitfly.berkeley.edu). All contigs in this submission meet the following cutoffs: length >= 400 bases, phrap computed error rate <= 1/10.  
 \* NOTE: This is a 'working draft' sequence. It currently consists of 29 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as \* runs of N, but the exact sizes of the gaps are unknown. \* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

The sequence of C. elegans cosmid F10C1  
Unpublished (1996)  
3 (bases 1 to 40014)  
Waterston, R.  
DIRECT SUBMISSION  
Submitted (20-FEB-1996) Robert Waterston  
Submitted by:  
Genome Sequencing Center  
Department of Genetics, Washington University,  
St. Louis, MO 63110, USA, and  
Sanger Centre, Hinxton Hall  
Cambridge CB10 1RQ, England  
e-mail: tw@genome.wustl.edu and jessesanger.ac.uk  
NEIGHBORING COSMID INFORMATION:  
The 5' cosmid is C18A3, 199 bp overlap; 3' cosmid is K05F1, 200 bp  
overlap. Actual start of this cosmid is at base position 196 of  
CELLF10C1; actual end is at 6257 of CELK05F1

NOTES:  
Coding sequences below are predicted from computer analysis, using  
the program GeneFinder (P. Green and L. Hillier, ms in  
preparation).

mailto:sapiens@watson.wustl.edu

NOTICE: This sequence may not represent the entire insert of this  
clone. It may be shorter because we only sequence overlapping  
clone sections once, or longer because we provide a small overlap  
between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:  
all regions were double stranded or sequenced with an alternate  
chemistry; an attempt was made to resolve all sequencing problems,  
such as compressions and repeats; all regions were covered by  
sequence from more than one subclone; and the assembly was  
confirmed by restriction digest.

MAPPING INFORMATION:  
The sequence of this clone was established as part of a mapping and  
sequencing collaboration between the NHGRI Chromosome 7 Mapping  
Project (Eric D. Green, Director), John D. McPherson in the  
Department of Genetics (Washington University), and the Washington  
University Genome Sequencing Center. For additional information  
about the map position of this sequence, see  
http://www.nhgri.nih.gov/DIR/CMB/CHR7, send  
mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu/gsc

SOURCE INFORMATION:  
Clone RG023M10 is from the first release of the human BAC library  
CITB-978SK-B. The library contains cloned DNA from the male  
fibroblast cell line 978SK. See: Shizuya et al., Proc. Natl.  
Acad. Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8  
(1996). This clone is available from Research Genetics, Inc.  
(http://www.resgen.com).  
VECTOR: pBelOBAC11  
Selection: chloramphenicol

NEIGHBORING SEQUENCE INFORMATION:  
The clone sequenced to the left is RG332B22. Actual start of this  
clone is at base position 1 of RG023M10; actual end is at 136170 of  
RG023M10.

COMMENT
NOTICE: This sequence may not represent the entire insert of this
clone. It may be shorter because we only sequence overlapping
clone sections once, or longer because we provide a small overlap
between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:
all regions were double stranded or sequenced with an alternate
chemistry; an attempt was made to resolve all sequencing problems,
such as compressions and repeats; all regions were covered by
sequence from more than one subclone; and the assembly was
confirmed by restriction digest.

MAPPING INFORMATION:
The sequence of this clone was established as part of a mapping and
sequencing collaboration between the NHGRI Chromosome 7 Mapping
Project (Eric D. Green, Director), John D. McPherson in the
Department of Genetics (Washington University), and the Washington
University Genome Sequencing Center. For additional information
about the map position of this sequence, see
http://www.nhgri.nih.gov/DIR/CTB/CHR7, send
mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu/gsc

SOURCE INFORMATION:
This clone was derived from human PAC library RPCI-5, prepared by
Pierer de Jong and coworkers at the Roswell Park Cancer Institute
(http://bacpac.med.buffalo.edu) using the method described by
Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from
one male donor.
The clone may be obtained either from Genome Systems, Inc.
(http://www.genomesystems.com) or Research Genetics, Inc.
(http://www.resgen.com); or from Pierer de Jong.
VECTOR: pCYPAC2
NEIGHBORING SEQUENCE INFORMATION:
This clone sequenced to the right is DJ0562A11. Actual start of
this clone is at base position 1 of DJ0899E09; actual end is at
150332 of DJ0899E09.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.

PT for diagnosis of abnormal cell function, by preparing cDNA that

PT reflects relative abundance of corresp. mRNA in specific human

PT tissues

PS claim 1: Page 552; 2245pp; Japanese.

CC A single-stranded DNA (or its complementary strand or the corresp.

CC double-stranded DNA) which comprises one of the 7837 "GS" sequences

CC given in 119001-T26837 and which is able to hybridise to part of

CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

CC sequences were obtained from 3'-directed cDNA libraries prepared

CC from various human tissues; synthesis of cDNA was initiated from the

CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-

CC untranslated sequence is unique to a particular mRNA species, almost

CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

CC is constructed so as to reflect accurately the relative abundance of

CC different mRNAs in the particular tissue from which it was derived.

CC The appearance frequency of a given GS in a cDNA library can be

CC determined (esp. using primers and probes derived from the GS

CC sequences) as a means of diagnosing abnormal cell function or for

CC recognising different cell types.

PT Helicobacter polynucleotide and polypeptide sequences - useful to

PT treat or prevent gastrointestinal infection

PS Disclosure; Page 176-179; 362pp; English.

CC This polynucleotide encodes Helicobacter pylori polypeptide

CC GHPO 1284 (see W71509). 85 Polynucleotides (see V52009-V52093)

CC encoding claimed Helicobacter polypeptides (see W71474-W71558) have

CC been identified in the H. pylori genome using a transposon shuttle

CC mutagenesis method in which Tmmax9 mini-blam was used for

CC insertional mutagenesis of an H. pylori gene library established in

CC Escherichia coli. The invention provides: methods for producing

CC these polypeptides in recombinant host systems, and related

CC expression cassettes, vectors and transformed or transduced host

CC cells; live vaccine vectors that contain polynucleotides of the

CC invention and which can be used to prevent or treat Helicobacter

CC infection; therapeutic and/or prophylactic methods involving

CC administration of polynucleotide molecules (either in naked form

CC or delivered with a delivery vehicle), polypeptides or monospecific

CC antibodies; methods for detecting the presence of Helicobacter

CC in samples using e.g. polynucleotide molecules; and methods for

CC purifying polypeptides of the invention.

 PT Human ciliary neurotrophic factor mutant sequence - useful for  
 PT establishing genotype associated with diseases of the nervous system  
 PT including senile dementia and amyotrophic lateral sclerosis  
 PS Example 1; Page 5-6; 9pp; Japanese.  
 CC The nucleotide sequence of a gene encoding a mutant human ciliary  
 CC neurotrophic factor (CNF). The gene contains one Intron. The mutant  
 CC gene was constructed by altering the sequence at the 3' end of the Intron  
 CC in the wild type gene (T03276) from GGCC to AGCC. This mutation creates  
 CC an alternative 3' splice acceptor site which frameshifts the open reading  
 CC frame by 1 base and causes the reading frame to terminate prematurely  
 CC after a further 24 amino acids. The new shorter coding sequence (T03274)  
 CC encodes a protein of 62 amino acids (R86298) instead of 200 amino acids.  
 CC The C-terminal 22 amino acids of the mutant protein sequence were linked  
 CC to keyhole limpet haemocyanin used to raise antibodies to the mutant  
 CC protein. These antibodies and the mutant gene can be used to detect  
 CC various nerve diseases such as senile dementia, amyotrophic lateral  
 CC sclerosis, progressive motor neuropathy and peripheral nerve  
 CC interference.

DR Direct administration of ciliary neurotrophic factor into central  
PT nervous system - to treat amyotrophic lateral sclerosis  
PS Example: Page 52-55; 74pp; English.  
CC Vector RP3224E2 (T62072) is a pMTT-based vector contg. the human  
CC ciliary neurotrophic factor (hCNTF) gene fused to a murine  
CC immunoglobulin signal peptide (see also W13388) under control of  
CC the murine metallothionein promoter, and also contg. the herpes  
CC simplex virus thymidine kinase gene at the NotI site. The vector  
CC was used to transfect baby hamster kidney (BHK) cells, allowing  
CC prodn. of biologically active hCNTF. These BHK cells can be  
CC encapsulated and administered to the central nervous system for  
CC treatment of amyotrophic lateral sclerosis.

PT New sequences from the 20q13 amplicon - used for detecting  
PT chromosomal abnormalities, particularly tumours, and for developing  
PT products for treating diseases  
PS Claim 1: Pages 61-62; 91pp; English.  
CC The sequence is that of a cDNA sequence cc49, which was isolated  
CC from the 20q13 amplicon. It shows homology to C2H2 zinc finger  
CC genes. It can be used as a probe for the detection  
CC of chromosomal abnormalities at 20q13. It and other  
CC sequences isolated from the 20q13 amplicon are consistently  
CC amplified in primary tumours. These sequences are useful as probes  
CC or as probe targets for monitoring the relative copy number of  
CC corresponding sequences from a biological sample such as tumour  
CC cells. The sequences can also be used in therapeutic applications  
CC for modulating the expression of the endogenous gene or the activity  
CC of the gene product. Examples of therapeutic approaches include  
CC antisense inhibition of gene expression, gene therapy, and monoclonal  
CC antibodies that specifically bind the gene products. The products can  
CC also be used in the treatment of other diseases, e.g. age-related  
CC macular degeneration, Leber's congenital amaurosis and retinitis  
CC pigmentation.

PI New sequences from the 20q13 amplicon - used for detecting  
PI chromosomal abnormalities, particularly tumours, and for developing  
PI products for treating diseases  
PS Claim 1: Pages 64-67; 91pp: English.  
CC The sequence is that of the genomic sequence of ZABC-1 (zinc finger  
CC amplified in breast cancer). It maps to the core of the 20q13.2  
CC amplicon and is overexpressed in primary tumours and breast cancer  
CC cell lines having 20q13.2 amplification. The exact coding region for  
CC the genomic sequence is not given. The sequence can be used as a  
CC probe for the detection of chromosomal abnormalities at 20q13. It and  
CC other sequences isolated from the 20q13 amplicon are consistently  
CC amplified in primary tumours. These sequences are useful as probes  
CC or as probe targets for monitoring the relative copy number of  
CC corresponding sequences from a biological sample such as tumour

PT New isolated prostate-derived nucleic acids - used to develop  
PT products which may have cytokine, immune regulatory, haematopoiesis  
PT regulating, anti-inflammatory or tumour inhibition activity  
PS Clam J; Page 228; 675pp; English.  
CC X4038 to X40715 represent 5' expressed sequence tags (ESTs) for human  
CC secreted proteins expressed in prostate, and encode the proteins given in  
CC Y11716 to Y11993 respectively. The proteins given represent the signal  
CC peptide and an N-terminal fragment of a secreted protein. The nucleic  
CC acid sequences can be used for producing secreted human gene products.  
CC They can also be used to develop products for diagnosis and therapy. The  
CC proteins obtained may have cytokine activity, cell proliferation and  
CC differentiation activity, haematopoiesis regulating activity, tissue  
CC growth regulation activity, reproductive hormone regulating activity,  
CC chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,  
CC receptor/ligand activity, anti-inflammatory activity, tumour inhibition  
CC activity or other activities. The products can be used in forensic, gene  
CC therapy and chromosome mapping procedures. The sequences can also be used  
CC for obtaining corresponding promoter sequences. The nucleic acids  
CC encoding the signal peptides can be used for directing extracellular  
CC secretion of a polypeptide or the insertion of a polypeptide into a  
CC membrane, or importing a polypeptide into a cell.

PT Plant cell transformed with DNA -
PT is for Bacillus thuringiensis toxic protein and is resistant to
PT Coleoptera pests
PS Disclousure; 35pp; English.
CC The btl3 gene is identical in nucleotide sequence to: 1) the B.t. gene
CC that is disclosed in European patent publication 0,213,818 (1987); and
CC the gene found in the B.t. strain which is disclosed in European patent
CC publication 0,149,162 (1985). The patent is for a transformed
CC plant cell which includes, inserted in its genome, the btl3 gene, or a
CC fragment which encodes a 66KD protein. The btl3 fragment is residues
CC 737-2497. The 66 kD protein is the active component of toxic crystal
CC protein produced by Bacillus thuringiensis and active against
CC Coleoptera. Plant cells contg. DNA encoding this protein are
CC protected against Coleoptera. A typical cassette for expression
CC in a plant contains the btl3 gene fused to a neo gene fragment (encoding
CC active neomycin phosphotransferase enzyme II), attached to the 35S
CC 3 promoter (5'-end) and to the polyadenylation/termination signals
CC of T-DNA gene 7 (3'-end). The prod. was P1VE38.

DE New gene encoding delta endotoxin of Bacillus thuringiensis -
PT effective as insecticide against Coleoptera.
PS Claim 1; Fig 8: 82pp; English.
CC The cryc gene encodes a delta endotoxin which is an insecticide
CC effective against Coleoptera and Lepidoptera. The sequence was
CC isolated from cDNA library, on a plasmid designated pBg212. The
CC plasmid can be used to construct an expression vector which can
CC be used to transform B. megaterium ATCC 35965. Colorado potato
CC beetle larvae treated with a suspension of cultured cells were
CC dead within one week. The gene may alternatively be inserted
CC directly into a plant which can then itself produce the active
CC toxin.
CC See also N82141.

DE New Cry IIB protein - obtd. from the cry II B gene in Bacillus
DE thuringiensis var. kurstaki, active against lepidopteran insects
FT Example 7; Fig 4A-4D; 39pp; English.
```

CC This sequence encodes CryIIIA crystal protein. The promoter from  
CC this sequence was fused to the protein coding region of the CryII  
CC gene (Q71077). The recombinant hybrid fusion gene expressed the CryII  
CC crystal protein more efficiently than its native promoter. Bacillus  
CC thuringiensis var. kurstaki produces crystal proteins during sporulation  
CC which are specifically toxic to certain orders and species of insects,  
CC esp. Lepidoptera. CryIIIB can be used in compositions used as insecticides,  
CC environmentally acceptable insecticides. (See also Q71025 and Q71027)

DR Bacterial growth inhibiting peptide(s) enterocin 900 or brochozin C  
PT - used to inhibit growth of susceptible bacteria in e.g. foodstuff,  
PT living animal, food preparation area or fermentation vessel

PS Claim 14; Page 127-129; 174pp; English.  
 CC PC03.4 comprises a food-grade plasmid from *Carnobacterium divergens*  
 CC LV13, a producer of the class II bacteriocin divergicin A. The  
 CC plasmid can be used to insert genes for use in probiotics, meat,  
 CC milk products, food or food products. PC03.4 can be used in new  
 CC methods for exporting bacteriocins from cells using divergicin A  
 CC signal peptide (see W59007). The invention provides plasmid  
 CC vectors in which a signal peptide or leader peptide sequence is  
 CC attached to DNA encoding a bacteriocin and to an immunity gene  
 CC specific for the bacteriocin. Bacteriocin cassettes encoding the  
 CC divergicin A signal peptide and two or more bacteriocins are used to  
 CC tailor the antibacterial spectrum of a producer strain to target a  
 CC range of spoilage or pathogenic bacteria, e.g. *Escherichia coli* and  
 CC *Salmonella*. Using the technology of multiple bacteriocin production  
 CC and delivery using lactic acid bacteria, a range of bacteriocins can  
 CC be produced in situ in human food, animal feed, the gastrointestinal  
 CC tract of humans and animals, and in the female genital tract.

 PT New bacteriocins enterocin 900 and brochocin-C - useful as food  
 PT preservatives and therapeutic antimicrobials  
 PS Claim 14; Page 126-128; 182pp; English.  
 CC The invention relates to peptides enterocin 900, brochocin-C that inhibit  
 CC bacterial growth. Microorganisms expressing the above peptides are used  
 CC to inhibit bacterial growth in foods (specifically meat), live animals  
 CC (applied topically), food preparation areas and fermentation vessels. The  
 CC bacteriocins enterocin 900, brochocin-C may be used directly, specifically  
 CC to inhibit bacteria that cause mastitis. Antibodies specific for the  
 CC peptides are used to detect expression of bacteriocins in cells. Secretory  
 CC vectors (containing sequences for a promoter, a leucocin A processing  
 CC peptide, a heterologous peptide, lacc and lacc) are used to process  
 CC bacteriocins, enzymes or other proteins, e.g. for use in food production

CC and as probiotics. *L. gelidium*, or other leucocin A-expressing bacteria,  
 CC inhibit the growth of *Listeria* and the sulphide-producing spoilage  
 CC organism *Lactobacillus sake*; they also improve the sensory properties  
 CC (smell, taste and colour) of meat, specifically ground beef. *L. gelidium*  
 CC can also be used in preparation of animal feeds (silage), as probiotic,  
 CC to control *Salmonella* in poultry intestines and therapeutically against  
 CC mucosal tissue infections. Treatment with bacteriocins provides vacuum-  
 CC packed meat products with predictable and longer storage life. The  
 CC secretion vectors can express several bacteriocins for broader spectrum  
 CC of activity, e.g. tailored for a particular target organism. The present  
 CC sequence represents a claimed plasmid vector PC03.4, which is a  
 CC food-grade plasmid.

 PT Computer-readable medium with recorded Streptococcus pneumoniae  
 PT polynucleotide sequences - useful in diagnostic kits and assays, and  
 PT pharmaceutical compositions and vaccines for Streptococcus  
 PT pneumoniae  
 PS Claim 1; Page 244-249; 1409pp; English.  
 CC The present invention describes a computer readable medium which has  
 CC the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded  
 CC on it, or a representative fragment or a sequence at least 95% identical  
 CC to SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1  
 CC to 391 (V52134 to V52524) are genomic fragments from Streptococcus  
 CC pneumoniae. The present invention also describes an isolated nucleic acid  
 CC molecule encoding a homologue of any of the fragments of the S. pneumoniae  
 CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced  
 CC by a process comprising: (a) screening a genomic DNA library using as a  
 CC probe a target sequence defined by any of the sequences in SEQ ID NO:1  
 CC to 391, identifying members of the library which contain sequences  
 CC that hybridise to the target sequence and isolating the nucleic acid  
 CC molecules from the members; or (b) isolating mRNA, DNA or cDNA produced  
 CC from an organism, amplifying nucleic acid molecules derived from the  
 CC sequence is homologous to amplification primers the amplification and  
 CC fragment of the S. pneumoniae genome to prime the amplification can be  
 CC isolating the amplified sequences. The computer readable medium can be  
 CC used in a computer-based system for identifying fragments of the  
 CC S. pneumoniae genome of commercial importance, or expression modulating

CC fragments of the S. pneumoniae genome. Products from the present  
CC invention can be used in diagnosis kits and assays, and pharmaceutical  
CC compositions and vaccines for S. pneumoniae.

PT Helicobacter polynucleotide and polypeptide sequences - useful to
PT treat or prevent gastrointestinal infection
PS Disclosure: Page 176-179; 362pp; English.
CC This polynucleotide encodes Helicobacter pylori polypeptide
CC GHPD 1284 (see W71509). 85 polynucleotides (see V52009-V52093)
CC encoding claimed Helicobacter polypeptides (see W71474-W71558) have
CC been identified in the H. pylori genome using a transposon shuttle
CC mutagenesis method in which Tmex9 mini-plam was used for
CC insertional mutagenesis of an H. pylori gene library established in
CC Escherichia coli. The invention provides: methods for producing
CC these polypeptides in recombinant host systems, and related
CC expression cassettes, vectors and transformed or transfected host
CC cells; live vaccine vectors that contain polynucleotides of the
CC invention and which can be used to prevent or treat Helicobacter
CC infection; therapeutic and/or prophylactic methods involving
CC administration of polynucleotide molecules (either in naked form
CC or delivered with a delivery vehicle), polypeptides or monospecific

PT New isolated Enterococcus faecalis polynucleotides and polypeptides
PT used to develop products for the detection of Enterococcus
PT use in vaccines for prevention or attenuation of Enterococcus
PT infection.
PS Claim 1; Page 1235-1239; 2084pp; English.
CC A computer readable medium has been developed which has recorded on it
CC 992 nucleotide sequences isolated from the Enterococcus faecalis genome.
CC X12938 to X13919 represent these nucleotide sequences which are primary
CC nucleotide sequences, also known as contigs. The computer-based system
CC can identify fragments of the Enterococcus faecalis genome with
CC commercial importance. The products can be used to detect the presence
CC of Enterococcus faecalis in samples. They can also be used for
CC diagnosing Enterococcal infection in an animal and monitoring
CC progression of disease, and for identifying agents which can be used to
CC modulate the growth or pathogenicity of Enterococcus faecalis, or
CC another related organism, in vivo or in vitro. In particular the
CC polypeptides encoded by the Enterococcus faecalis nucleotide sequences
CC can be used in vaccines to prevent or attenuate an Enterococcal
CC infection.

 PT Mutant lentivirus Env protein principal immuno-dominant domains -  
 PT can produce neutralising antibodies to protect against e.g. FIV or  
 PT HIV, but do not produce facilitating antibodies

PS Claim 6, Page 21: 38bp: French.  
 CC The present sequence encodes a specifically claimed example of a novel  
 CC peptide fragment which is a mutant of the wild-type (w.t.) principal  
 CC immunodominant domain (PID) of feline immunodeficiency virus such  
 CC that an Env protein containing the fragment retains the ability to  
 CC produce neutralising antibodies (Abs) but does not produce  
 CC facilitating or deleterious Abs against the w.t. PID. The mutated  
 CC Env protein can be used for producing vaccines against FIV. In  
 CC addition to vaccination, the peptide fragment is useful as a  
 CC diagnostic reagent, specifically to distinguish between Abs produced  
 CC in response to vaccination and those resulting from viral infection.  
 CC Also, the results of anti-FIV vaccination can be monitored  
 CC using the peptide.

 PT New sequences from the 20q13 amplicon - used for detecting  
 PT chromosomal abnormalities, particularly tumours, and for developing  
 PT products for treating diseases  
 PS Claim 1: Pages 61-62; 91pp: English.  
 CC The sequence is that of a cDNA sequence cc49, which was isolated  
 CC from the 20q13 amplicon. It shows homology to C2H2 zinc finger  
 CC genes. It can be used as a probe for the detection  
 CC of chromosomal abnormalities at 20q13. It and other  
 CC sequences isolated from the 20q13 amplicon are consistently  
 CC amplified in primary tumours. These sequences are useful as probes  
 CC or as probe targets for monitoring the relative copy number of  
 CC corresponding sequences from a biological sample such as tumour  
 CC cells. The sequences can also be used in therapeutic applications  
 CC for modulating the expression of the endogenous gene or the activity  
 CC of the gene product. Examples of therapeutic approaches include  
 CC antisense inhibition of gene expression, gene therapy, and monoclonal  
 CC antibodies that specifically bind the gene products. The products can  
 CC also be used in the treatment of other diseases, e.g. age-related  
 CC macular degeneration, Leber's congenital amaurosis and retinitis  
 CC pigmentations.

PS Claim 1; Page 49; 173pp; English.  
CC V68800 to V68998 represent nucleotide sequences which encode human  
CC breast tumour specific polypeptides. Detection or measurement of  
CC human breast tumour specific polypeptides and nucleotide sequences,  
CC or the corresponding RNA in a sample, is used for diagnosis and  
CC monitoring of breast cancer. Human breast tumour specific polypeptides  
CC and nucleotide sequences, and the vectors containing the DNAs, are also  
CC useful in vaccines for inhibiting development (for prevention or  
CC therapy) of breast cancer. The polypeptides may also be used to  
CC raise monoclonal antibodies, used as immunoassay reagents.

PS Claim 1; Page 388; 633pp; English.  
CC This sequence represents an expressed sequence tag (EST), and is a

CC polynucleotide of the invention. The polynucleotides of the invention are  
CC all secreted EST sequences isolated from a variety of human tissue  
CC sources. The EST sequences and proteins encoded by them are predicted to  
CC have useful biological activities which would make them suitable for  
CC treating, preventing or ameliorating medical conditions in humans and  
CC animals, although no supporting data is given. Suggested activities  
CC include nutritional activity, immune stimulating or suppressing activity,  
CC haematopoiesis regulating activity, tissue growth activity,  
CC activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic  
CC activity, thrombolytic activity, receptor/ligand activity, anti-inflammatory  
CC activity, cadherin/tumour invasion suppressor activity, tumour inhibition  
CC therapy.

DR Computer readable medium with recorded Streptococcus pneumoniae  
PT polynucleotide sequences - useful in diagnostic kits and assays, and  
PT pharmaceutical compositions and vaccines for Streptococcus  
PT pneumoniae  
PS Claim 1: Page 1078-1080; 1409pp; English.  
CC The present invention describes a computer readable medium which has  
CC the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded  
CC on it, or a representative fragment of a sequence at least 95% identical  
CC to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1  
CC to 391 (V52134 to V52524) are genomic fragments from Streptococcus  
CC pneumoniae. The present invention also describes an isolated nucleic acid  
CC molecule encoding a homologue of any of the fragments of the S.pneumoniae  
CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced  
CC by a process comprising: (a) screening a genomic DNA library using as a  
CC probe a target sequence defined by any of the sequences in SEQ ID NO:1  
CC to 391, identifying members of the library which contain sequences  
CC that hybridise to the target sequence and isolating the nucleic acid  
CC molecules from the members; or (b) isolating mRNA, DNA or cDNA produced  
CC from an organism, amplifying nucleic acid molecules whose nucleotide  
CC sequence is homologous to amplification primers derived from the  
CC fragment of the S. pneumoniae genome to prime the amplification and  
CC isolating the amplified sequences. The computer readable medium can be  
CC used in a computer-based system for identifying fragments of the  
CC S. pneumoniae genome of commercial importance, or expression modulating  
CC fragments of the S. pneumoniae genome. Products from the present  
CC invention can be used in diagnosis kits and assays, and pharmaceutical  
CC compositions and vaccines for S. pneumoniae.

PT Novel Streptococcus pneumoniae proteins and related DNA - useful for  
PT diagnosing anti-microbial agents for treatment of bacterial  
PT infections  
PS Claim 4; Page 244; 483pp; English.  
CC This sequence encodes a Streptococcus pneumoniae protein that (based on  
CC homology with an Escherichia coli protein) is a pfs protein, and  
CC represents a DNA sequence of the invention. The DNA sequences were  
CC isolated from Streptococcus pneumoniae strain 0100993 (NCIMB 40794). The  
CC Streptococcus pneumoniae proteins of the invention can be used to  
CC identify compounds which interact with and inhibit or activate the  
CC activity of the proteins. Antagonists can be used to treat diseases  
CC caused by S. pneumoniae proteins, through genetic immunisation. They can  
CC also be used to induce an immunological response in a mammal by  
CC inoculation with the S. pneumoniae proteins or delivery of the encoding  
CC nucleic acids in a vector adequate to produce antibody and/or T cell  
CC immune responses to protect the animal from disease. The proteins can  
CC also be used to identify antimicrobial compounds which are capable of  
CC inhibiting their bioactivity. In particular the proteins of the invention  
CC can be used to prevent adhesion of bacteria to mammalian extracellular  
CC matrix proteins on in-dwelling devices or in wounds, to block protein-  
CC mediated mammalian cell invasion, and to block the normal progression of  
CC pathogenesis in infections initiated other than by the implantation of  
CC in-dwelling devices or other surgical techniques.

PT New nucleic acid from Staphylococcus aureus NCIMB 40771 - useful  
PT for, e.g. diagnosis; prevention and treatment of bacterial  
PT infection(s)  
PS Claim 4; Page 60; 114pp; English.  
CC The present sequence encodes Staphylococcus aureus WCHU (NCIMB 40771)  
CC proteins that have homology to a Bacillus subtilis xanthine  
CC permease and transport protein. The proteins are used to generate  
CC antibodies and to screen for antimicrobials. The products are used  
CC to treat or prevent bacterial infections, particularly

where caused by *S. aureus* but also against *Helicobacter pylori*.  
CC Particular applications are to treat subjects before surgery or  
CC insertion of an indwelling device (alternatively the device itself is  
CC impregnated before placement). The nucleic acid sequence is used as  
CC sources of antisense sequences (for therapeutic use) or regulatory  
CC elements for controlling expression of bacterial genes, and for  
CC antibacterial screening. The protein can be also used as a vaccine.

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -  
PT stored on computer readable medium and used in the production of  
PT anti-S.aureus vaccines  
PS Claim 1; Page 1794; 3271pp; English.  
CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences  
CC of the invention. The DNA sequences are recorded on a computer readable  
CC medium, preferably selected from a floppy or hard disk, random access  
CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using  
CC the S.aureus DNA sequences allows putative functions to be assigned so  
CC that protein-encoding or regulatory regions of commercial, therapeutic or  
CC industrial importance can be obtained. Specifically, sequences which are  
CC likely to encode antigens have been identified and these polypeptides can  
CC be used in a vaccine composition against S.aureus infection. The  
CC polypeptides can also be used in a kit for the immunodetection of  
CC S.aureus in a sample. S.aureus is implicated in numerous human diseases,  
CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,  
CC skin and surgical wound infections, scalded skin syndrome, toxic shock  
CC syndrome, etc. Organisms transformed with the DNA sequences can be used  
CC for recombinant production of the polypeptides. The new DNA sequences  
CC (and their fragments) are useful as primers or probes for isolating  
CC homologues of any of the S.aureus DNA sequences contained on the  
CC computer readable medium.

 PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -  
 PT stored on computer readable medium and used in the production of  
 PT anti-S. aureus vaccines  
 PS Claim 1: Page 1142-1146: 3271pp; English.  
 CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S. aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The S. aureus polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the computer readable medium.

 PT vaccines, drug screening, etc  
 PS Claim 5: Page 153: 354pp; English.  
 CC X30724 to X30946 represent genomic DNA sequences isolated from  
 CC Streptococcus pneumoniae strain 0100993. These genomic DNA sequences  
 CC encode the novel proteins given in Y1114 to Y1167. The proteins,  
 CC isolated from Streptococcus pneumoniae, can be used in vaccines against  
 CC streptococcal infections and in assays for identifying compounds that  
 CC inhibit or activate the activity of the proteins. The antagonists can  
 CC be used to treat an individual having need to inhibit a bacterial  
 CC protein. Vectors expressing the proteins can be used to induce a  
 CC protective immune response in mammals.

Direct Submission
Submitted (12-APR-1999) Whitehead Institute/MIT Center for Genome
Research, 320 Charles Street, Cambridge, MA 02141, USA
On Apr 12, 1999 this sequence version replaced gi:4580489.
All repeats were identified using RepeatMasker: Smit, A.F.A. &
Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html

Only 126732 base pairs from the middle of this clone are being
submitted. The remainder overlaps either accession number AC003950
(WICR project L261) or accession number AC004584 (WICR project
L312).

Wilkinson-Sproat,J. and Wohldman,P.  
2.2 Mb of contiguous nucleotide sequence from chromosome III of C.  
elegans  
Nature 368 (6466), 32-38 (1994)  
94150718  
Coding sequences below are predicted from computer analysis, using  
predictions from Genefinder (P. Green, U. Washington), and other  
available information.  
For a graphical representation of this sequence and its analysis  
see:  
http://webc.sanger.ac.uk/cgi-  
bin/display?db=wormbase&class=Sequence&object=F46B6  
Current sequence finishing criteria for the C. elegans genome  
sequencing consortium are that all bases are either sequenced  
unambiguously on both strands, or on a single strand with both a  
dye primer and dye terminator reaction, from distinct subclones.  
Exceptions are indicated by an explicit note.  
IMPORTANT: This sequence is NOT necessarily the entire insert of  
the specified clone. It may be shorter because we arrange for a small  
overlapping sections once, or longer because we arrange for a small  
overlap between neighbouring submissions.  
This sequence is the entire insert of clone F46B6. The true right  
end of clone F58B6 is at 12346 in this sequence. The start of this  
sequence (1..104) overlaps with the end of sequence 270754.  
The end of this sequence (36513..36616) overlaps with the start of  
sequence 272305.

BAC clone F16F14 is from Arabidopsis chromosome II and is near the  
molecular marker m1398.  
The orientation of the sequence is from SP6 to T7 end of the BAC  
clone.  
Genes were identified by a combination of three methods: Gene  
Prediction programs including GRAIL (available by anonymous ftp  
from arthur.epm.ornl.gov), GeneFinder (Phil Green, University of  
Washington), Genscan (Chris Burge,  
http://genomic.stanford.edu/~chris/GENSCANW.html), and NetPlantGene  
(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the  
complete sequence against a peptide database and the Arabidopsis  
EST database at TIGR (http://www.tigr.org/tdb/at.html).  
Annotated genes are named to indicate the level of evidence for  
their annotation. Genes with similarity to other proteins are named  
after the database hits. Genes without significant peptide  
similarity but with EST similarity are named as 'unknown' proteins.  
Genes without protein or EST similarity, that are predicted by more

than two gene prediction programs over most of their length are  
annotated as 'hypothetical' proteins. Genes encoding tRNAs are  
predicted by tRNAscan-SE (Sean Eddy,  
http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are  
identified by RepeatMasker (Arian Smit,  
http://ftp.genome.washington.edu/RM/RepeatMasker.html). Regions of  
genomic sequence that are not annotated as genes but have predicted  
exons by GRAIL are annotated as misc features.

```

NOTE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:  
The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see <http://www.nhgri.nih.gov/DIR/GRB/CHR7> or send mailto:egreen@nhgri.nih.gov

SOURCE INFORMATION:  
This clone is from a release of the human BAC library. The library contains cloned DNA from human sperm. See: Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); Kim et al., Genomics 34:213-8 (1996). The clone is available from Research Genetics, Inc. (<http://www.resgen.com>).  
VECTOR: paeloBac11  
Selection: chloramphenicol

NEIGHBORING SEQUENCE INFORMATION:  
The actual start of this clone is at base position 1 of RG354L07; actual end is at 78154 of RG354L07. The orientation of this clone

is unknown.

This clone contains STS's SMS2071 (NID:91113356) and SMS2179 (NID:91113411).

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:  
all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:  
The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see  
http://www.nhgri.nih.gov/DIR/CTB/CHR7 or send  
mailto:egreen@nhgri.nih.gov

SOURCE INFORMATION:  
Clone RG119H12 is from the first release of the human BAC library CTB-978SK-B. The library contains cloned DNA from the male fibroblast cell line 978SK. See: Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8 (1996). This clone is available from Research Genetics, Inc. (http://www.resgen.com).  
VECTOR: pBelOBAC11  
Selection: chloramphenicol

NEIGHBORING SEQUENCE INFORMATION:  
The actual start of this clone is at base position 1 of RG119H12; actual end is at 103566 of RG119H12. The orientation of this clone is unknown.

This clone contains STS SWS61320 (NID:91222757).

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:  
all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:  
The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see  
http://www.nhgri.nih.gov/DIR/GRB/CHR7, send  
mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu/gsc

SOURCE INFORMATION:  
This clone was derived from human PAC library RPCI-5, prepared by Pieter de Jong and coworkers at Roswell Park Cancer Institute, using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from one male donor. For further details, see http://bacpac.med.buffalo.edu/  
The clone is available from Genome Systems, Inc.  
(http://www.genomesystems.com).

VECTOR: pcypac2  
NEIGHBORING SEQUENCE INFORMATION:  
The clone sequenced to the left is DJ0981B16, the clone sequenced to the right is DJ1159C10. Actual start of this clone is at base position 1 of DJ0870F17; actual end is at 155382 of DJ0870F17.

RESULT 13
LOCUS HSCOS10 40247 bp DNA PRI 06-DEC-1998
DEFINITION Homo sapiens chromosome 3 subtelomeric region.
ACCESSION AF109718
VERSION 93978547
KEYWORDS AF109718.1 GI:3978547
SOURCE human.
ORGANISM Homo sapiens
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
Eutheria; Primates; Catarrhini; Hominidae; Homo.
REFERENCE
1 (bases 1 to 40247)
Traak,B.J., Rowen,L., Nguyen,O., Massa,H.F., Giorgi,D.,
Brand-Arpon,V. and Rouquier,S.
Sequence of a genomic duplication found at the subtelomeric region
of several chromosomes
Unpublished
2 (bases 1 to 40247)
Rowen,L.
Direct Submission
Submitted (27-NOV-1998) Department of Molecular Biotechnology, Box
357730 University of Washington, Seattle, Washington 98195, USA
Sequencing methodology: High redundancy shotgun. Interspersed
Repeats were identified with RepeatMasker (available from
http://ftp.genome.washington.edu/RW/RepeatMasker.html).

\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 1 contigs. Gaps between the contigs  
\* are represented as runs of N. The order of the pieces  
\* is believed to be correct as given, however the sizes  
\* of the gaps between them are based on estimates that have  
\* provided by the submitter.  
\* This sequence will be replaced  
\* by the finished sequence as soon as it is available and  
\* the accession number will be preserved  
1 201175: contig of 201175 bp in length.

**COMMENT** On Sep 11, 1998 this sequence version replaced gi:2335056. BAC clone CIT987SK-972D3 is located in band 16p13.11 of chromosome 16. Genes were identified by a combination of five methods: XGRAL (available by anonymous ftp from artur.epm.ornl.gov), GeneFinder (available by anonymous ftp from collins.washington.edu), GENSCAN (available using the e-mail server at genesan@genomic.stanford.edu), searches of the EST database at TIGR (<http://www.tigr.org/tdb/hcd/hcd.html>) and searches against a peptide database. Repeats were identified using RepeatMasker (Smith, A.F.A. and Green, P. unpublished, <http://ftp.genome.washington.edu/rm/RepeatMasker.html>).

RESULT 7
LOCUS HS434014 135928 bp DNA PRI 10-JUN-1999
DEFINITION Homo sapiens DNA sequence from PAC 434014 on chromosome 1q32.3.-41.
            Contains the HSD11B1 gene for Hydroxysteroid (11-beta)
            Dehydrogenase 1, the ADORA2BP adenosine A2b receptor like
            pseudogene, the IRF6 gene for Interferon Regulatory Factor 6 and
            two novel genes. Contains ESTs and GSSs, complete sequence.

SOURCE  
ORGANISM Homo sapiens  
REFERENCE Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;  
AUTHORS Eutheria; Primates; Catarrhini; Homiidae; Homo.  
TITLE 1 (bases 1 to 135928)  
JOURNAL  
Graham, D.  
Direct Submission  
Submitted (10-JUN-1999) Sanger Centre, Hinxton, Cambridgeshire,  
CB10 1SA, UK. E-mail enquiries: humquerry@sanger.ac.uk  
requests: clonerequests@sanger.ac.uk  
On Jul 30, 1998 this sequence version replaced gi:3046735.  
434014 is from the library RPO13 constructed at the Roswell Park  
Cancer Institute by the group of Pieter de Jong  
For further details see <http://bacpac.med.buffalo.edu/During>  
sequence assembly data is compared from overlapping clones. Where  
differences are found these are annotated as variations together  
with a note of the overlapping clone name. Note that the variation  
annotation may not be found in the sequence submission  
corresponding to the overlapping clone, as we submit sequences with  
only a small overlap as described above.  
The following abbreviations are used to associate primary accession  
numbers given in the feature table with their source databases:  
EM: EMBL; SW: SWISSPROT; Tr: TREMBL  
This sequence is the entire insert of clone 434014. The true left  
end of clone 447D17 is at 135829 in this sequence. The true right  
end of clone 447D17 is at 2719 in this sequence. This sequence has  
been finished according to sequence map criteria as follows. An  
attempt is made to resolve all sequencing problems, such as  
compressions and repeats, but not necessarily within known  
annotated human repeat sequence elements (e.g. Alu). Where the  
sequence is ambiguous, there is an annotation using the 'unsure'  
feature key  
This sequence was generated from a human chromosome 1 bacterial  
clone contig, constructed in collaboration by the Sanger Centre  
chromosome 1 mapping group and Brian Schutte, Bryan Bjork, Kevin  
Coppage and Jeffrey Murray.  
Further information can be found at  
<http://www.sanger.ac.uk/HGP/Chr1>.

Submitted (24-FEB-1999) Genome Sequencing Center, Washington University School of Medicine, 444 Forest Park Parkway, St. Louis, MO 63108, USA

## COMMENT

\* NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

TITLE Direct Submission  
JOURNAL Submitted (20-MAY-1999) Drosophila Genome Center, Lawrence Berkeley  
Laboratory, MS 64-121, Berkeley, CA 94720, USA  
COMMENT On May 24, 1999 this sequence version replaced g1:4883580.

For further information about this sequence, including its location  
and relationship to other sequences, please visit our sequence  
archive web site (<http://www.fruitfly.org/sequence/>) or send email  
to [bdg@fruitfly.berkeley.edu](mailto:bdg@fruitfly.berkeley.edu). All contigs in this submission meet  
the following cutoffs: length >= 400 bases, phrap computed error  
rate <= 1/10  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 29 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

 NEIGHBORING COSMID INFORMATION:  
 The 5' cosmid is C18A3, 199 bp overlap; 3' cosmid is K05F1, 200 bp overlap. Actual start of this cosmid is at base position 196 of CEF10C1; actual end is at 6257 of CEF105F1  
 NOTES:  
 Coding sequences below are predicted from computer analysis, using the program Genefinder (P. Green and L. Hillier, ms in preparation).

## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- ☐ BLACK BORDERS
- ☐ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
- ☒ FADED TEXT OR DRAWING
- ☐ BLURRED OR ILLEGIBLE TEXT OR DRAWING
- ☐ SKEWED/SLANTED IMAGES
- ☐ COLOR OR BLACK AND WHITE PHOTOGRAPHS
- ☐ GRAY SCALE DOCUMENTS
- ☐ LINES OR MARKS ON ORIGINAL DOCUMENT
- ☐ REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY
- ☒ OTHER: Upside down Duplex Pages

**IMAGES ARE BEST AVAILABLE COPY.**

**As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.**
